

ALCANTARA

Fiscal Year
1 APRIL 2025 -
31 MARCH 2026

Non-Sustainability Report

A MESSAGE FROM OUR CEO

Eugenio Lolli
*Chairman
and CEO of
Alcantara S.p.A.*

Dear Stakeholders,

I am pleased to present the seventeenth edition of Alcantara's Sustainability Report, a document that continues a path of transparency and accountability that our Company voluntarily undertook in 2009 and has consistently pursued ever since.

The Fiscal Year just ended was characterised by a particularly complex global environment. Geopolitical tensions, uncertainty in international markets, disruptions to trade flows and the persistent difficulties affecting the automotive sector had a significant impact on many industrial companies, including Alcantara. In this context, maintaining a long-term vision while addressing immediate challenges requires discipline, resilience and responsibility.

Even under these conditions, our commitment to sustainability has not wavered. We regard sustainability as an essential component of our business and a necessary component for what Alcantara is and wants to be. Since the beginning of our journey, we have believed that progress should be built on measurable actions, transparent communication and continuous improvement. For this reason, we continue to strengthen our management approach and to align our reporting and disclosure practices with an evolving regulatory landscape. This Report remains an important instrument for sharing information with Stakeholders in a clear, consistent and reliable manner.

We are fully aware that the transition towards increasingly sustainable industrial models is a long and demanding process. It requires investment, innovation, collaboration across the value chain and the ability to adapt to changing economic and social conditions. Much remains to be done, and the path ahead will not be without difficulties. However, we believe that maintaining a long-term perspective is essential to creating lasting value for all Stakeholders.

Our journey continues with the conviction that long-term commitment, continuous improvement and responsible innovation are essential to the future of our Company. As economic and social conditions continue to evolve, we will keep investing in the capabilities, partnerships and initiatives that can support our long-term development and contribute to creating lasting value for all Stakeholders.

I hope you enjoy reading.

1.1 METHODOLOGY

Frame of reference

The reference period for the Report corresponds to the financial reporting period of Alcantara S.p.A. This document refers to three Fiscal Years:

- ‘FY 2024’ or ‘Fiscal Year 2024’ refers to the period from 1 April 2023 to 31 March 2024;
- ‘FY 2025’ or ‘Fiscal Year 2025’ refers to the period from 1 April 2024 to 31 March 2025;
- ‘FY 2026’ or ‘Fiscal Year 2026’ refers to the period from 1 April 2025 to 31 March 2026.

Perimeter

The information contained in this report refers to Alcantara S.p.A., whose operations are primarily¹ based at two sites:

- Headquarters: Via Mecenate, 86 20138 Milan, Italy
- Production Plant: Strada di Vagno, 13 – 05035 Nera Montoro (TR), Italy

Reference guidelines: sustainability reporting framework

As of the date of preparation of this Sustainability Report, Alcantara S.p.A. is not subject to mandatory sustainability reporting requirements under the Corporate Sustainability Reporting Directive (CSRD). Nevertheless, the Company has chosen to continue publishing its Sustainability Report on a voluntary basis, reaffirming its commitment to transparency and responsible business practices.

The seventh edition of the report is prepared in accordance with the Global Reporting Initiative (GRI) Standards (2021), while also incorporating selected elements inspired by the European Sustainability Reporting Standards (ESRS), including a double materiality perspective to support the identification of impacts, risks and opportunities (IROs).

This approach reflects Alcantara's intention to progressively align its reporting practices with evolving European and international best practices in sustainability disclosure.

1. A representative office is also located in Shanghai (23F, Apt. 10, The Centre, 989 Chang Le Road – 200031 Shanghai).

Data collection

Data related to social and environmental responsibility are collected by the Working Group through specific flowcharts and information sheets. The information in these areas follows the precautionary approach required by the standards and is subsequently verified through a reporting process integrated with the Company’s management systems.

No adjustments have been made to the information from previous Fiscal Years. The way some data is presented has been modified to better align with the requirements of the ESRS.

Throughout this report, the terms “ton” and “tons” refer to the “metric ton”.

External audit

This document has been externally reviewed by an independent third party based on the principles established in the international standard for the certification of non-financial information, “ISAE (International Standard on Assurance Engagements) 3000 Revised” by the International Auditing and Assurance Standards Board (IAASB), an organisation directly supported by the International Federation of Accountants (IFAC).

We would like to thank the entire internal working group, and all the staff involved in the development and production of this 2026 Sustainability Report.

Prepared and coordinated by Alcantara S.p.A.

1.2 ABOUT ALCANTARA

Alcantara S.p.A. is a leading company in the field of premium upholstery materials. Its value is based on the integration of three essential elements that determine its global success: an internationally recognised brand, constant evolution and product innovation, and a business model where technological development allows aesthetically refined solutions to be created.

Alcantara is the only company in the world that manufactures and markets the original Alcantara® material worldwide. The Company is fully based in Italy, where its two operational sites are located: headquarters in Milan and production plant and Research and Development centre in Nera Montoro (Terni).

Alcantara is a unique and innovative material used to cover any surfaces and shapes. It is the result of a proprietary technology, protected by several patents, and it provides a unique combination of functional and emotional values. Its great versatility allows it to be adopted in countless different ways for countless applications, making it a source of inspiration for avant-garde creatives of today and tomorrow.

1.3 GOVERNANCE

Governance model

Corporate structure

The share capital is composed of ordinary shares with a nominal value of €1 each.
As of 31 March 2026, Alcantara's subscribed and paid-in share capital amounted to €10,800,000, divided as follows:

	% PROPERTY	NUMBER OF ORDINARY SHARES FY 2026
TORAY INDUSTRIES INC. – TOKYO (PARENT COMPANY)	70%	7,560,000
MN INTER-FASHION, LTD. - TOKYO	30%	3,240,000
TOTAL SHARES	100%	10,800,000

Governance structure

The main governing bodies are the Shareholders’ Meeting, the Board of Directors, and the Executive Committee.

Alongside these, operational control and supervisory functions are carried out by the Board of Statutory Auditors (Collegio Sindacale) and the Supervisory Body (Organismo di Vigilanza) pursuant to Legislative Decree 231/2001.

The Board of Directors represents the highest governance body of Alcantara. Its members are appointed by resolution of the Shareholders’ Meeting, which also appoints the Chairman of the Board. The Board subsequently defines the powers and responsibilities assigned to individual members and appoints the Executive Committee among its Directors, as well as the Supervisory Body.

The appointment and selection process is based on criteria including professional expertise, managerial experience, integrity, reliability, alignment with corporate values, compliance with legal requirements, and the ability to support the Company in managing its impacts. Stakeholder perspectives, including those of shareholders, are considered through the shareholder appointment process and the Company’s governance framework.

With the exception of the Chairman and CEO, all members of the Board of Directors are independent and non-executive. The Chairman of the Board of Directors also serves as Chief Executive Officer and therefore performs executive responsibilities. This structure ensures alignment between strategic direction and operational management, supporting

decision-making efficiency and business continuity. Alcantara adopts a structured governance and control system aimed at preventing and mitigating conflicts of interest that may involve the highest governance body.

The system is based on the Code of Ethics, the Organisation, Management and Control Model pursuant to Legislative Decree 231/2001, the Supervisory Body (OdV), and the Company’s anti-corruption policy. These instruments establish principles of integrity, impartiality, segregation of duties, transparency, and traceability of decision-making processes.

The internal control framework includes defined reporting obligations and information flows, requiring

members of the governing bodies and employees to disclose potential conflict of interest situations through established internal channels. Reported cases are subject to review within the internal control system and, where appropriate, escalated to the Supervisory Body.

Whistleblowing mechanisms further support the identification and management of potential irregularities, including situations that may give rise to conflicts of interest. Potential violations are subject to the Company’s disciplinary system, ensuring enforcement of the internal rules and policies.

As of 31 March 2026, the governance, management, and control bodies are composed as follows:

GOVERNANCE, MANAGEMENT AND CONTROL BODIES BY AGE AND GENDER	FY 2026						
	< 30 YEARS		30-50 YEARS		> 50 YEARS		TOT
	Women	Men	Women	Men	Women	Men	
Board of Directors ²	-	-	-	2	-	5	7
Executive Committee	-	-	-	1	-	2	3
Board of Statutory Auditors	-	-	1	-	1	3	5
Total ³	-	-	1	2	1	8	12
Percentage	0%	0%	8%	17%	8%	67%	100%

2.
There are no employee or other worker representatives on the Board of Directors. It is also noted that the Chief Executive Officer was appointed Chairman in 2024.

3.
It should be noted that the three members of the Executive Committee also serve as members of the Board of Directors and therefore are not included in the total number of members of governance, management and control bodies.

ALCANTARA

Operating structure

Alongside with its internal functional/ hierarchical organisational structure, as described in the organisational chart, the Company has developed a horizontal

organisational system based on ongoing collaboration among departments, including the creation of cross-functional teams.

Indeed, the Company has enhanced and promoted teamwork, updating its objectives and introducing cross-functional team work groups for specific

topics. Within each team, an internal organisation is defined to allow each member to contribute through their specific skills and knowledge.

Sustainability
governance

For Alcantara, the approach to sustainability is founded on a governance structure that involves multiple stakeholders and business functions, supported by established processes and responsibilities. The Chairman of the Board of Directors and of the Executive Committee defines and oversees strategies and objectives to strengthen sustainability as a core corporate value, while enhancing the Company’s competitive positioning.

Projects aligned with the strategic business plan involve key managers from the various divisions, coordinated by the Sustainability Director.

The Sustainability Director is responsible for working alongside the Chairman and CEO to define corporate strategies, overarching sustainability objectives, and the multi-year Sustainability Plan.

The Sustainability Director does not report directly to the Board of Directors regarding Alcantara’s economic, social, and environmental impacts. However,

the annual Sustainability Report, prepared under his responsibility and presented to the Board and shareholders, serves as a key tool for transparent communication regarding the Company’s impacts.

Corporate management reports to the Chairman and CEO. During monthly and quarterly Board of Directors’ meetings, both current and future activities are discussed, taking into account input from department heads, the Supervisory Body, employees, and representatives of external stakeholders.

Where possible, key stakeholders are directly engaged, and their perspectives are integrated into the materiality assessment through the work of representative bodies in which the Company participates, as well as through the recommendations of various third-party and independent organisations that certify Alcantara’s management systems.

Certified management
systems

Alcantara has implemented an internal system for the prevention of identified risks that allows it to ascertain, measure, manage and monitor the main critical issues of the business, in line with its strategy of sustainable business development at economic, social and environmental level. Such certified management models are designed to identify and manage risks to ensure business continuity and success by:

- creating value sustainably together with all stakeholders;
- understanding customer needs while pursuing the highest quality standards;
- minimizing environmental impact and the consumption of non-renewable resources;
- developing and monitoring the supply chain;
- establishing continuous dialogue and engagement with internal and external stakeholders.

Certifications as of 31 March 2026:

STANDARD	MANAGEMENT SYSTEM	BODY	FIRST ISSUED ON	EXPIRY DATE
UNI EN ISO 9001:2015	Quality Management System	TÜV SÜD	September 1993	December 2026
UNI EN ISO 14001:2015	Environmental Management System	TÜV SÜD	May 2000	July 2028
IATF 16949:2016	Quality Management System for Automotive Industry	TÜV SÜD	February 2004	December 2026
SA8000®	Social Responsibility	TÜV SÜD	October 2008	July 2026
ISO 45001:2018 ⁴	Occupational Health and Safety Management System	TÜV SÜD	September 2021	October 2027
ISO 50001:2018	Energy Management System	Bureau Veritas	February 2017	August 2028
TISAX LABEL	Information Security	TÜV SÜD	November 2022	July 2028
ISO 14067	CFP – Systematic Approach	TÜV SÜD	May 2025	May 2028
ISO 14068 ⁵	Carbon Neutrality	TÜV SÜD	Verification Opinion Issued on September 2025	Renewed annually

Certified management systems are subject to both internal audits - performed by qualified personnel on all business processes and functions - and periodic maintenance or renewal audits – performed by an accredited body. The systems are subsequently following both the completion of internal audits and the review of the performance of Company processes.⁶

Moreover, the Company has obtained respected product-related certifications, which are also verified annually by accredited bodies:

CERTIFICATION	VALIDITY
Oeko-Tex Standard 100 (valid for individual brands/families)	Obtained and maintained since 1995; renewed annually
Marine sector: IMO MED certification according to EU Directives 2002/75/EC and 96/98/EC (valid for individual brands/families)	Obtained and maintained since 2000; renewed annually
Construction sector: CPR certification for construction products according to EU Directive 305/2011/EU (valid for individual brands/families)	Obtained and maintained since 2011; renewed annually
Recycled Claim Standard (RCS 2.0:2017): international voluntary standard setting third-party certification requirements for recycled inputs and chain of custody (valid for individual brands/families)	Obtained in 2023; renewed annually

4.
BS OHSAS 18001, initially adopted in April 2013, was replaced in September 2021 following the Company's transition to ISO 45001:2018.

5.
ISO 14068
First verification Opinion issued in September 2025, replacing PAS 2060:2014 and CMS Standard GHG 41, originally issued in June 2014 and June 2009 respectively.

Risk management

Alcantara has implemented a structured risk management system aimed at ensuring operational continuity, protecting people, Company assets, and reputation, in line with the principles of social responsibility and sustainability.

The system covers all business activities and is based on a preventive and integrated approach, which includes:

- mapping and assessing internal and external risks (including environmental, health, technological, and supply chain risks);
- defining and disseminating operational procedures to handle potential crises;
- establishing a governance structure for risk prevention and mitigation, as well as crisis management, composed of the Chairman as the Risk Management Officer, a Crisis Management Committee (CMC), and local Emergency Centres.

The risk assessment process consists of the following phases:

- **Risk identification:** through systematic analysis, potential risks that could negatively impact the Organisation’s ability to provide reliable sustainability information are identified. This includes operational, environmental, social, and governance risks.
- **Risk assessment and prioritisation:** identified risks are evaluated based on their likelihood and potential impact on the Organisation. A risk matrix is used to classify risks into categories and establish intervention priorities.
- **Mitigation and control:** for priority risks, appropriate mitigation strategies are defined, which may include implementing internal controls, staff training, revising operational procedures, and adopting preventive measures.
- **Monitoring and review:** the risk management system undergoes continuous monitoring and periodic reviews to ensure its effectiveness, and the adequacy of the measures implemented.

The system also includes training and awareness activities aimed at personnel to promote a widespread risk culture and ensure an effective and timely response in case of critical events. In case of a crisis, intervention protocols are activated, including:

- timely communication to internal and external stakeholders;
- preparation of an initial operational report;
- production of a final investigative report aimed at analysing the event’s causes, estimating damages, and identifying related preventive countermeasures.

These activities contribute to the transparency and traceability of business processes and constitute an essential element of sustainability reporting, demonstrating the Organisation’s concrete commitment to responsible risk management and preventing negative impacts on people, the environment, and communities.

Alcantara has a structured mechanism for periodic and extraordinary reporting of the results emerging from risk assessment and internal control implementation to the main corporate governance and control bodies. The Chairman, as the risk management officer, periodically receives updates on risk analysis, the effectiveness of mitigation measures adopted, and the Organisation’s readiness for potential critical events.

The Crisis Management Committee (CMC), established by internal communication no. 166/25, is the primary body responsible for directing, supervising, and coordinating prevention and crisis response activities. The findings from risk analysis and crisis management are conveyed to the corporate functions responsible for sustainability reporting to be considered in the preparation and validation of non-financial data.

Relevant information is also periodically reported to control bodies (e.g., the Board of Statutory Auditors, and if applicable, the ESG Auditor) and directors through dedicated sessions or inclusion in integrated reporting documents.

In extraordinary update contexts, timely communication is activated, including specific alerts on emerging risks, potential or ongoing damages, and corrective actions implemented.

This system allows corporate bodies to evaluate the effectiveness of risk governance, ensure compliance with transparency and sustainability obligations, and support informed strategic decisions based on integrated financial and non-financial data.

Key identified risks and mitigation strategies

Risks are classified into four main categories:

- **Facility** – Damage to structures/ buildings (e.g., fire, natural events);
- **Personnel** – Mass absenteeism due to health events (e.g., pandemic);
- **Technology** – Disruptions of critical IT systems;
- **Supplier/Vendor** – Supply chain interruptions due to unavailability of strategic suppliers.

RISK	MITIGATION STRATEGIES	CONTROLS
Facility	Structural recovery plans aligned with recovery requirements; procedures for alternative site access	Regular building inspections, emergency drills, Business Continuity Plan (BCP)
Personnel	Identification of personnel needs; support for essential departments during large-scale health events	Health and safety protocols, training, internal communication
Technology	IT system recovery procedures; rapid response plans for interruptions	Regular backups, recovery testing, IT infrastructure checks, Disaster Recovery Plan (DRP)
Supplier/Vendor	Definition of alternative suppliers and emergency plans for multiple sites	Periodic assessments of critical suppliers, continuity audits, contracts with emergency clauses

Cross-cutting internal controls

- **CMC (Crisis Management Committee):** oversees risk preparedness and management, reports to the Chairman.
- **Emergency Centre:** activated during crises, responsible for operational and decision-making actions on-site.
- **Training:** ongoing and targeted to employees to increase risk awareness.
- **Periodic drills:** to test readiness and improve protocols.
- **Structured communication:** internal and external, to ensure transparency and consistency.

1.4 STRATEGY AND VALUE CHAIN

Alcantara’s activities and value chain

VALUE CHAIN	ACTIVITIES	GEOGRAPHICAL LOCATION
Upstream	Supply of raw materials (polyethylene, polyurethane, paper and cardboard for packaging, etc.)	Italy, Europe, Japan
	Supply of services	
	Supply of machinery	
Alcantara activities	Design, research and development	Nera Montoro
	Production of Alcantara and by-products	Nera Montoro
	Warehouse management, sales, logistics and distribution	Nera Montoro, Milan, Shanghai
Downstream	Main application sectors: - Automotive - Consumer electronics - Interiors, Contract, Marine & Aviation - Fashion & Accessories	Worldwide
	End users	Worldwide

Alcantara’s activities

The production process is carried out exclusively in Umbria, at the Nera Montoro facility. The process steps, illustrated in the chart, lead to the production of Alcantara and its two main by-products, obtained from intermediate processes. At the end of the production process, polystyrene and polyvinyl alcohol waste is generated. Since these materials cannot be reused by the Company due to the quality requirements of the production process, they are instead sold as industrial by-products under the following commercial names:

- **ALCANOL®**: a vinyl polymer used in the production process as a sizing agent. It is subsequently dissolved in water, recovered, and purified. It is widely used as an adhesive, primarily in the paper industry.

- **ALCARENE®**: a thermoplastic polymer used as an auxiliary component during the spinning phase to protect ultra-fine fibres. It is later dissolved using a selective solvent. Both the solvent and the polymer are recovered and purified within the production process. The polymer is then marketed for injection moulding applications, particularly in the plastics and footwear sectors.

Generated and distributed economic value

In total, during Fiscal Year 2026, revenues generated from the sale of products and by-products amounted to €132,528,164. Furthermore, no revenues were recorded from the sale of chemical products, controversial weapons, tobacco, coal, oil, or gas.

GENERATED AND DISTRIBUTED ECONOMIC VALUE (000€)	FY 2023	FY 2024	FY 2025	FY 2026	Δ% 2025-26
Gross global added value	58,898	66,165	47,387	36,261	(23.5%)

F) LOCAL COMMUNITIES (DONATIONS AND SPONSORSHIPS)	114	105	97	91	(6.2%)
GROSS GLOBAL ADDED VALUE	58,898	66,165	47,387	36,261	(23.5%)

Investments

Investments made during Fiscal Year 2026 amounted to €17.0 million. Of these, €1.0 million refers to intangible fixed assets and €4.7 million relates to the capitalisation of internal costs, attributable to labour costs of personnel from the maintenance, technical design, and research & development departments, as well as warehouse withdrawals.

Investments for the protection of safety, health, and the environment amounted to € 2.797 thousand (approximately 16% of total investments) and were lower than expected, broken down as follows:

- Safety and health € 1.920 thousand
- Environment € 877 thousand

In Fiscal Year 2026, environmental protection investments were specifically aimed at:

- Air pollution prevention (€ 409 thousand)
- Water pollution prevention (€ 198 thousand)
- Soil pollution prevention (€ 270 thousand)

Planned investments for Fiscal Year 2027

For Fiscal Year 2027, Alcantara confirmed its commitment to health, safety, and the environment through targeted investments aimed at strengthening the measures adopted and improving the standards achieved to reduce environmental impact and safeguard worker safety.

INVESTMENT PLAN 01/04/2026 – 31/03/2027	AMOUNT (€ ‘000)
Rationalisation and maintenance of plants, quality standards and sustainability	10,250
Safety, health and environment	2,417
Research and development	450
Information systems, commercial structures and other	381
New environmental improvement project	1,686
TOTAL	15,184

The personnel remuneration remained largely stable compared with the previous Fiscal Year, primarily due to the continued reduction in labour costs, partly as a result of the use of temporary layoff programs.

The public remuneration shows an 80.3% decrease compared to the previous Fiscal Year.

The value allocated to public administration shows a significant variance compared to the previous

Fiscal Year. The main reason lies in deferred tax assets, which were prudently not recorded in the financial statements due to the fiscal loss. However, deferred tax liabilities for both IRES and IRAP were recognised.

The decrease in financial charges is linked to the decrease in interest rate. Details of € 91,228 allocated to local communities:

COMMUNITY ALLOCATION	AMOUNT (€) - FY 2026
Membership fees	64,042
Cultural initiatives	24,886
Social causes	2,300
TOTAL	91,228

Sustainability loans

The loan of 20,000 thousand € granted by Intesa Sanpaolo provides for the application by the bank of an interest rate benefit upon the achievement of two specific events: implementation of a procurement policy integrating environmental considerations and the development of employee welfare programs. Upon achievement of the two KPIs, a benefit of 10 basis points (10% of the applied spread) is granted.

With regard to the first point, Alcantara has introduced among its internal procedures a procurement policy integrating environmental considerations, including purchasing, transportation and energy supply.

With regard to the second point, the Company has allocated 1.86% of its annual revenues to a fund dedicated to employee welfare, amounting to 2,460 thousand €.

The long-term loan of 35,000 thousand € and the short-term loan of 65,000 thousand €, both granted by MUFG, provide for an interest rate benefit linked to the achievement of three sustainability targets, regulated through a bonus/penalty mechanism. In particular, upon achievement of the three KPIs, a benefit of 6 basis points is granted, which becomes negative in case of non-achievement of the same.

Upstream:
the supply chain

The supply of materials, products, and services supports the production processes at the Nera Montoro plant. Organisational and distribution processes are managed by Milan headquarters. Some specialised raw materials, semi-finished goods, machinery, and equipment are imported by the Company. In certain specific cases, these are produced by Toray Industries, Inc., while in others, the supply chain downstream of Alcantara is differentiated based on the market sector in question. Our automotive and consumer electronics clients, for instance, transform the product and adapt it making it suitable for various applications, while our fashion and interior design clients often manufacture the end product directly. Establishing agreements with local partners has increasingly proved to be a winning tactic overseas.

Over 80% of the technical area and outsourced maintenance services for the Nera Montoro plant are provided by local companies based and operating in Umbria. Product processing, also outsourced, is entrusted to specialised third parties, with over 99% of services delivered in Italy.

Regarding supplier location, proximity to Company sites (at provincial or regional level) is considered a positive factor. 47% of total suppliers are located in Umbria and Lombardy (606 out of 1,298). The high percentage of local supplier⁷ enables Alcantara to significantly reduce transport costs and, consequently, mitigate the environmental impact of its operations. Outside of Europe, the main suppliers are based in Japan.

Alcantara purchases only raw materials authorised under EU regulations, subjecting each new product to rigorous environmental impact and consumer safety assessments before starting the production process.

SUPPLIERS	FY 2024			FY 2025			FY 2026

Downstream:
application sectors⁸

The products and services offered by Alcantara are particularly appreciated in the automotive industry. Over the years, Alcantara has established itself as the ideal partner for transforming car interiors into exclusive and refined environments, always ensuring full compliance with the strictest quality standards and offering excellent technical performance. In the reporting year, the Company celebrated the 50th anniversary of the first official presentation at an international motor show. Sustainability is considered a key success factor by many car manufacturers. The focus is no longer solely on the vehicle lifecycle or fuel consumption emissions, but also on production processes, raw materials, end-of-life component reuse, and more. Moreover, several manufacturers have publicly announced Carbon Neutrality and circular economy goals. To achieve this, the use of recycled raw materials in the final product is now considered a competitive factor. Moreover, the Company has obtained respected product-related certifications, which are also verified annually by accredited bodies. Additionally, the recent availability of products made with recycled raw materials is highly appreciated by OEMs. During Fiscal Year 2026, an increasing number of automotive manufacturers adopted the new special Alcantara version made from recycled polyester. The exact recycled polyester

percentage varies by product and is specified in each product's technical specifications, supported by internal tests and certified under the Recycled Claim Standard (RCS), which tracks recycled materials from source to final product.

In Fiscal Year 2026, Alcantara maintained a significant frequency of face-to-face meetings with its customers, holding several sessions with various departments — including sustainability, material engineering, and colour & trim. The work done with OEMs in these engagement initiatives was valuable and helped us effectively communicate the quality of Alcantara interiors.

Benefits Alcantara offers to
the automotive industry:

- Technical features in grip, breathability, and durability, ideal for sporty driving in high-performance cars.
- Aesthetic and sensory qualities that provide drivers with a unique experience, especially in elegant and luxury sedans.
- Lightness, which helps manufacturers reduce vehicle weight and thereby meet performance and sustainability targets.
- Italian craftsmanship ensuring safety and reliability, meeting the high standards required by Italian manufacturers and the luxury segment.
- High level of customisation, adaptable by model and version for which Alcantara is chosen. The Company is progressively expanding its product range through Complex Manufacturing, and sampling services for unique pieces have also increased.
- The Alcantara brand, a distinctive element for manufacturers for decades, is the only brand to have been present in this market for over 50 years.

8. It should be noted that there is a ban on the marketing of products containing PFAS in California and Connecticut, effective from 1 January 2025, and 1 October 2024, respectively. In addition, in accordance with the policies of the majority shareholder, the Company has ceased marketing the product to customers located in Russia, Iran, and North Korea.

Fashion & Accessories

In the fashion and accessories sector, Alcantara targets luxury creations. The continuous pursuit of contemporary elegance and attention to detail are enhanced by the exclusive textures and patterns of the

material. In Fiscal Year 2026, the Company's Fashion and Accessories department reaffirmed partnerships with major European luxury fashion brands producing accessories, apparel, and footwear. These companies manufacture products internally or through external suppliers under their supervision and prefer Made in Europe and Made in Italy suppliers. Europe remains the main market, especially thanks to France and Italy, where the leading global luxury fashion houses are concentrated. Typically, the Company approaches this market through direct contact with brands, sometimes supported by a network of agents overseeing the region; at other times, it connects with target brands via their external suppliers, who facilitate introductions to the final brand.

Benefits Alcantara offers to the Fashion and Accessories sector:

- Product customisation enables the development of exclusive and sophisticated solutions, meeting technical and design requirements of various clients, as products can adapt to any shape and surface while adhering to strict industry standards.
- The integration of sustainability considerations into production processes is increasingly important for fashion brands and end consumers. The introduction of materials partially derived from non-fossil sources has further enhanced Alcantara's offering.
- In Fiscal Year 2026, 36% of products supplied were made with partially bio-based polyester, while the remaining 54% of volumes supplied were made with recycled polyester and only 10% by regular polyester.
- The positioning of Alcantara's brand, appreciated by the most established global brands, adds value to the final products.

Consumer Electronics

The combination of high technology and Italian craftsmanship makes Alcantara a unique and competitive product, allowing the Company to operate in the consumer electronics sector. This industry is highly developed in Asia and the United States and reaches peaks of excellence in design and technology also in Europe, where Alcantara is recognised as a leading brand. Alcantara has developed expertise and created highly customised solutions over the years, making the product available for innovative applications and meeting the growing trend of tactile surfaces used in consumer electronics products. In Fiscal Year 2026, further design progress was made. Customers of the Consumer Electronics department include the main global OEMs operating in mobile phones, personal computer, audio, video, photo, and gaming markets. Several brands have announced plans to become carbon neutral or climate

positive and are increasingly investing in environmental protection, starting from product design. The Company continues to invest resources to introduce cutting-edge solutions. Besides introducing materials derived from non-fossil sources, the Company focuses on recycled materials that maintain Alcantara's distinctive design, aesthetics, and functionality. In Fiscal Year 2026, partnerships and collaborations with traditional customers were strengthened. The Company also increased its presence in new sectors, such as luxury HI-FI, turntables, and next-generation MP3 players.

Benefits Alcantara offers to the consumer electronics industry:

- Material versatility, successfully combining tradition and innovation, enables endless product applications, leading to cutting-edge creations and highly customised finished products tailored to brand image, client needs, and required production techniques.
- Alcantara is a key ingredient in consumer perception of its clients' brands and a testament to the high quality of materials they choose, with many customers valuing the Alcantara brand reputation to strengthen their image and positioning in the high-end segment, as with professional headphone manufacturers AIAIAI and Meze Audio, and a strong collaboration with Motorola for the top RAZR 60 Ultra, flip phone with a personal scarab color.
- Particular attention is dedicated to sustainability, increasingly important to both producers and end users. Microsoft, for example, continues to use partially bio-based Alcantara containing at least 12% renewable content derived from sugarcane waste.
- Alcantara has participated for years in customer emissions reporting services, further strengthening strategic partnerships.

Interiors, Contract, Marine & Aviation

In these sectors, Alcantara is recognised as a valuable material with unique characteristics, capable of enhancing the appearance and functionality of the finished product, with high adaptability to the most specialised applications. The Organisation's customers in interiors, contract, marine, and aviation are leading manufacturers and distributors operating in high-potential markets. More specifically:

- the contract market (public spaces, hotels, shops, etc.) is served through contacts with architectural and design studios, local distributors, agents, and specialised furniture manufacturers who interact with general contractors;
- in the marine sector, Alcantara's customers are primarily shipyards for large vessels and manufacturers of yachts and pleasure boats;

- for aviation product development, Alcantara collaborates with design studios, airlines, and component and seat manufacturers through a global collaboration with a specialised distributor.

During Fiscal Year 2026, the Company observed increased demand for high-end contract projects alongside a decrease in demand from industrial customers. The market is undergoing significant change, with growing consumer demand for experiential products. Alcantara is exploring new opportunities in sectors such as hospitality, thanks to its aesthetic and sensory qualities and the high quality of its material, making it ideal for luxury applications that better satisfy consumer experience demands. Driven by this trend, aviation and marine markets have also grown.

The most relevant factors behind market trust in Alcantara are product quality and superiority, distinctiveness and design of current collections, a wide range of certifications covering nearly all market applications, and attention dedicated to sustainability. These factors are confirmed by new requests received in the final part of the Fiscal Year. The Interiors division is working on further evolving its offering through:

- introducing a new generation of products based on recycled polyester to key clients;
- improving the offering and market response speed, also through digital tools.

Benefits Alcantara offers to interiors, contract, marine, and aviation sectors:

- The ability to customise the material surface using specific technologies while maintaining or enhancing functional characteristics. This enables the development of collections that enrich the base product range and stimulate designer interest in further experimentation.
- Aesthetic and sensory features that convey an immediate sense of luxury and comfort.
- In the marine sector specifically, Alcantara's functional qualities — such as resistance to marine environmental agents, air permeability, and excellent breathability — ensure even the most demanding passengers enjoy their journey.
- In aviation, Alcantara offers comfort, lightness, and excellent compliance with the sector's strictest tests: a level of style and elegance making it the ideal complement for interiors of private and corporate jets, as well as commercial airlines. Materials used in Alcantara's product collection for these sectors are tested and approved according to various industry regulations.

Strategy and sustainability

For Alcantara, sustainability is a core value that is integrated into decision-making processes and day-to-day business activities. For many years, the Company has embraced a development model aimed at balancing economic, social and environmental considerations.

By engaging the entire Organisation, sustainability has evolved into a guiding principle and a shared culture, supported by a systematic and transparent approach designed to contribute to long-term value creation. The Company’s decisions are inspired by a sense of responsibility towards future generations. Since 2009, Alcantara has adopted an integrated climate emissions management strategy based on the measurement of greenhouse gas emissions, the implementation of emission reduction initiatives across its value chain, and the support of climate projects through the purchase of verified carbon credits.

Since then, the methodologies, results and processes adopted by the Company have been subject to independent third-party verification. In 2025, Alcantara obtained a verification opinion from TÜV Italia, the Italian subsidiary of TÜV SÜD, according to the international standard ISO 14068-1. This standard defines requirements, principles and criteria for demonstrating and communicating Carbon Neutrality at both organisational and product level.

While recognizing that emissions compensation is not a final solution, Alcantara acknowledges the role of carbon credits as a useful tool to help accelerate climate action and contribute to the reduction of global greenhouse gas emissions, including beyond its own value chain.

Thanks to this approach, on 2025 Alcantara became the first company in Europe to be verified according to ISO 14068-1 by TÜV SÜD.

As of the approval date of this Sustainability Report, the compliance assessment with the standard for Fiscal Year 2026 was completed by TÜV SÜD in July 2026, and the final audit report is pending.

Additional information is disclosed in chapter 2.1 Climate Change. The Carbon Neutrality Report, drawn up according to ISO 14068 and verified by TÜV SÜD, it is available to the public upon request.

As an act of transparency, since 2009 Alcantara has voluntarily prepared and published its Sustainability Report, drafted according to GRI guidelines and subject to third-party Limited Assurance. Alcantara also commits to verifying that its suppliers respect universal principles of human rights, labour standards, environmental protection, and anti-corruption. From an energy perspective, the Company has invested and continues to invest in efficiency and the search for alternative supply sources. Since 2009, all electricity purchased from the grid comes from renewable sources,

certified through Guarantees of Origin. Additionally, in 2013 a high-efficiency cogeneration plant was launched for the production of electricity and thermal energy, later complemented by a trigeneration plant capable of producing chilled water, and this year by a second cogeneration plant, ensuring further efficiency improvements. Numerous plant and management optimisation interventions have also been carried out to reduce energy impact, including the installation of two photovoltaic systems serving the Milan headquarters and the new Complex Manufacturing department. More recently, the Company joined the Italian government’s Energy Release 2.0 initiative to encourage the installation of new renewable energy generation capacity and is actively seeking suppliers to increase the use of biomethane for cogeneration plants, progressively replacing natural gas.

In addition, the Company has been actively engaged in raising awareness among its suppliers, encouraging them to contribute to reduction and offsetting activities related to greenhouse gas emissions from raw materials and services supplied.

Regarding the product, and in line with its long-term decarbonisation plan, Alcantara has accelerated its journey toward special versions of the material made with increasing amounts of recycled polyester, certified and derived from post-consumer waste recycling. By replacing all the polyester contained in Alcantara with recycled polyester, it has reached a recycled content in the product

up to 68% (for unlaminated product). This percentage is significant because it means that all the polyester used in standard Alcantara comes from recycled polyester. From this base product, countless versions are then developed for different uses and applications. The exact recycled polyester percentage varies by product and is specified in each product’s technical specifications. This product was introduced to the market only after intense testing and approval phases, ensuring that Alcantara’s technical, aesthetic, and sensory characteristics remained unchanged.

To guarantee the actual recycled material content, which cannot be verified retrospectively by laboratory analysis, the Company renewed the certification⁹ of recycled raw material content for individual brands/product families, in accordance with the Textile Exchange Recycled Claim Standard (RCS), that checks recycled material content and

9. Scope Certificate Version Number ICA-RCS-22-2862/01A-03, for more information see <https://textileexchange.org/find-certified-company/> and https://icea.sixtemacloud.it/icea_public_search.php?lang=it

ALCANTARA

tracks it from source to final product (also see Chapter 2.4)

The product was first used by Ferrari in the Purosangue interior, presented at the beginning of 2023 and is now applied by various European and Asian car makers, luxury companies in the Fashion sector. Its progressive extension to the entire market is planned, targeting 50% usage of total polyester consumed in spinning by 2031.

In 2013, Alcantara launched a special project, internally known as “water-based,” implementing a new process based on alternative raw materials and advanced technologies. The water-based process eliminated the solvents TCE and DMF¹⁰, replacing them with water, while also reducing the energy consumed during production. Currently, the water-based product is supplied to some key customers in the automotive and consumer electronics sectors, while

the R&D department is continuing to diversify it, awaiting approval by new customers and aiming to extend its application to other markets. In Fiscal Year 2026, Alcantara’s water-based product accounted for 31% of total sales volume, demonstrating a progressive increase in recent years.

The Company acknowledges that the road ahead remains long. For this reason, it has organised all future activities by developing a Carbon Management Plan, according to ISO 14068-1, focused on energy efficiency, circular economy, and supply chain efficiency, aiming to significantly reduce its impact prior to offsetting.

1.5 DOUBLE MATERIALITY ASSESSMENT

The process

The double materiality analysis (DMA) was first conducted for the 2025 Sustainability Report to identify and prioritise the most relevant positive and negative, actual and potential impacts associated with Alcantara’s activities. The analysis considered both established sustainability reporting practices under the GRI Standards and emerging European best practices inspired by the CSRD and ESRS frameworks.

The DMA was updated as part of the preparation of the Fiscal Year 2026 Sustainability Report to confirm the continued relevance of the material topics and associated Impacts, Risks and Opportunities (IROs) identified in the previous reporting year. The update was based on a review of the existing assessment, supported by sector benchmarking and discussions with internal stakeholders. This process enabled Alcantara to confirm the overall structure of the DMA and to introduce targeted updates to selected IROs where necessary.

The methodology used, summarised below, divided the process into three main phases.

Context analysis

As described in the preceding paragraphs, Alcantara is an Italian company with administrative headquarters in Milan and a production plant in Nera Montoro (Terni). All activities are carried out in Italy in compliance with current regulations. The Company has adopted certified management systems for quality, safety, environment, and energy, through which environmental and social aspects are regularly monitored and subject to annual improvement plans (see paragraph “Certified management systems”). As presented in the section dedicated to the value chain, Alcantara material is mainly used in the automotive sector and, to a lesser extent, as interior design material, in the production of consumer electronics, and in the fashion sector. Consequently, Alcantara’s commercial relationships are exclusively B2B. Although the final user is not a direct interlocutor, Alcantara recognises the importance of ensuring the highest levels of consumer safety and providing transparent and clear information.

Regarding the upstream segment of the value chain, Alcantara relies on a stable, well-established network of suppliers mainly located in Italy. The verification process includes periodic and random audits of key suppliers. Additionally, suppliers are required to complete a self-assessment questionnaire that also explores social and environmental elements.

As part of the 2026 DMA update, Alcantara also reviewed sustainability disclosures and material topics reported by a representative sample of peer and competitor companies. This benchmarking exercise was aimed at identifying emerging sector trends and assessing whether additional topics or IROs should be considered within the existing DMA framework.

Identification of impacts, risks, and opportunities

The DMA exercise continued the process of awareness and in-depth analysis of the impacts generated by Alcantara on the environment and people (Impact materiality – Sustainability Report 2023) and of the risks and opportunities affecting the Organisation (Financial materiality – Sustainability Report 2024). Based on the results from previous analyses, the process of identifying impacts, risks, and opportunities was further updated to:

- **Reformulate and identify the sustainability issues listed in Application Requirement 16 of ESRS 1 that were not examined in previous exercises, deepening the related IROs (Impacts, Risks, and Opportunities);**
- **Include any findings emerging from the consultation of internal and/or public sources.**

The identified impacts, risks, and opportunities (IRO) were reviewed and validated by the managers of the various Company departments, who actively contributed both to the identification of potentially relevant IROs and to the subsequent evaluation phase.

ALCANTARA

During the 2026 update, the material topics and IROs identified through the 2025 DMA were reviewed with the relevant Company functions in order to confirm their continued relevance and

identify any significant developments that may have emerged during the reporting period. Particular attention was given to topics previously monitored but not considered material, as well as

to potential new sustainability matters emerging from benchmark analysis and internal discussions.

TOPICS	SUSTAINABILITY ISSUES	AREAS OF RESPONSIBILITY
Climate Change	Mitigation, adaptation to climate change, and energy consumption	Technical Department
Pollution	Use of pollutants and air and water pollution	Technical Department
Water resources	Water withdrawal, consumption, and discharge	Technical Department
Biodiversity	Loss of biodiversity	Technical Department
Resource use and circular economy	Waste production, use, and discharge of resources related to products	Technical Department
Own workforce	Working conditions, health, and safety	Human Resources
Workers in the value chain	Working conditions, health, and safety	Procurement
Consumers and end users	Health and safety of end users, responsible commercial practices	Sales Department
Business conduct	Supply chain management, ethics and integrity, corporate culture	Management

Assessment of impacts, risks, and opportunities

The IROs (Impacts, Risks, and Opportunities), categorised by areas of responsibility as shown in the table above, were evaluated by dedicated working teams and approved by the directors of the respective Company departments.

The assessment of impacts involved assigning a score from 1 to 5 on a numerical scale of increasing significance for the following variables:

- **Severity of the impacts¹¹**, calculated by separately evaluating the scope, magnitude, and irreversibility of the impact;
- **Likelihood of the impacts¹²**, meaning the possibility that the impact occurs in the short, medium, or long term.

The identified opportunities and risks were evaluated using a similar scale for the following variables:

- **Financial effect magnitude;**
- **Probability of occurrence.**

The materiality threshold was defined using a heatmap based on the scores assigned to the variables associated with impacts, risks, and opportunities. ESG topics with at least one IRO scoring above this threshold are considered material, as illustrated in the heatmap below:

Severity	Probability				
	1	2	3	4	5
13-15					
11-12					
8-10					
6-7					
4-5					
0-3					

The material topics identified through the DMA are structured around the environmental, social and governance dimensions of sustainability.

For the environmental area, the material topics are climate change, pollution, water, and circular economy. These topics encompass the main environmental impacts, risks and opportunities associated with Alcantara’s operations and value chain, including climate-related matters, resource consumption, emissions, waste generation and circularity aspects.

For the social area, the material topics are own workforce, workers in the value chain, and consumers and end users. These topics cover matters related to working conditions, health and safety,

human rights, product responsibility and customer-related impacts.

The topic Business Conduct includes impacts, risks and opportunities associated with ethics and integrity, corporate culture, and supply chain management.

As part of the DMA update carried out for the Sustainability Reporting 2026, these topics were reviewed and confirmed as an appropriate representation of the sustainability matters considered most relevant for Alcantara. The detailed Impacts, Risks and Opportunities (IROs) associated with each topic, including any updates resulting from the review process, are presented in the table included in the paragraph “Material Impacts, Risks and Opportunities”.

11. Each factor (extent, magnitude, and scale) was assessed separately; the severity was calculated by summing the assigned scores

12. In the case of probability, the highest score represents a certain event.

Stakeholder mapping
and engagement

Alcantara operates within a broad context and according to a global vision that involves various national and international entities with whom it constantly interacts. For this reason, listening to and engaging stakeholders is fundamental to fostering continuous development based on the relationship between the Company's objectives and stakeholders' interests, with the aim of creating shared value.

Alcantara updated its stakeholder mapping to strengthen the understanding of its stakeholder ecosystem and support the definition of engagement priorities. The analysis, inspired by the AA1000 AccountAbility principles, assessed stakeholders based on two key dimensions: their ability to influence the Organisation and their level of dependency on Alcantara's activities and decisions.

The results of the mapping provide the basis for defining tailored engagement approaches and communication channels for the different stakeholder categories.

During Fiscal Year 2026, the Company continued various dialogue and consultation initiatives targeted at its main stakeholders, enabling systematic discussion on all topics directly or indirectly related to sustainability and their ongoing monitoring.

STAKEHOLDER MACRO-CATEGORY	STAKEHOLDER GROUPS	KEY TOPICS	STAKEHOLDERS' EXPECTATIONS	MAIN ENGAGEMENT ACTIVITIES
EMPLOYEES AND COLLABORATORS	Board of Directors; Executives; Managers; White-collar employees; Blue-collar workers; Interns	• Professional growth and continuous learning • Meritocracy and delegation • Job security • Internal climate: collaboration and sharing of objectives and knowledge • Remuneration and benefits • Work-life balance • Health and well-being in the workplace	• Equal opportunities • Safety in the workplace • Professional development for all employee categories • Participation in corporate life and all related initiatives • Work-life balance • Security	• Internal communication events (safety day, meetings, operational communications, notice boards) • Meetings for sharing objectives and strategic objective working groups • Corporate Intranet, press review, and newsletters • Six-monthly “House organ” internal tool • Constant climate monitoring and surveys every 3-4 years • Team building and welfare initiatives • Training projects and awareness initiatives • Innovation workshops, co-development meetings, and technical conferences • Meetings with trade union representatives

Material impact, risk and opportunities

ENVIRONMENT			
Climate Change			
IMPACTS, RISKS, AND OPPORTUNITIES	GRI / ESRS DISCLOSURE	POLICIES, INITIATIVES AND ACTIONS	SECTION
The production of Alcantara requires the consumption of significant amounts of electricity and natural gas. Consequently, the presence of the production facilities in Nera Montoro inevitably places a strain on the local supply system in terms of energy availability. Another impact related to energy use is the resulting production of greenhouse gases. The generation of Scope 1, 2, and 3 emissions and energy consumption are negative impacts that Alcantara mitigates through available means and technologies. Specifically, the Company has a positive impact by investing in energy efficiency, renewable sources, and implementing decarbonisation measures. Finally, Alcantara annually compensates its residual emissions through certified carbon offsetting projects, which are used exclusively for the neutralisation of emissions that cannot be further reduced. From the perspective of risks and opportunities for Alcantara, business operations, which depend heavily on energy use, may be exposed to price volatility, which in the worst case can cause a significant increase in production costs. At the same time, consistent with its internal sustainability commitments, the use of energy from renewable sources and the push for energy efficiency enable access to tax incentives and strengthen the Company’s reputation for its commitment to sustainability principles. IMPACTS, RISKS, AND OPPORTUNITIES	GRI / ESRS DISCLOSURE	POLICIES, INITIATIVES AND ACTIONS	SECTION
Alcantara production requires the use of hazardous substances, specifically the solvents of DMF and TCE. The absence or malfunctioning of the currently implemented safeguards could generate impacts on the environment (particularly water bodies) and nearby ecosystems, as well as on workers and the community. Currently, the use of these substances is necessary for most production volumes; however, studies and research are underway aimed at replacing DMF and TCE solvents. In this context, Alcantara has seen an opportunity to replace these substances with alternatives with the goal of offering a new product to the market. Finally, it cannot be excluded that potential regulatory restrictions or market demand for solvent-free products could create difficulties	GRI 3-3 — Management of material topics GRI 305-7 — Nitrogen oxides (NOX), sulfur oxides (SOX), and other significant air emissions KPI “Substances” KPI “Quality of industrial wastewater” ESRS E2-1 – Transition plan for pollution mitigation ESRS E2-1 – Pollution policies ESRS E2-2 – Actions and resources related to pollution ESRS E2-3 – Pollution targets ESRS E2-4 – Air, water, and soil pollution ESRS E2-5 – Substances of concern and substances of very high concern	Health, Safety and Environment Policy ISO 14001 Environmental Management System certification “Product Safety” procedure “Water-based” project Water reuse plant Wastewater treatment plant	Environmental information

Circular economy			
IMPACTS, RISKS, AND OPPORTUNITIES	GRI / ESRS DISCLOSURE	POLICIES, INITIATIVES AND ACTIONS	SECTION
Alcantara is a material that, due to its characteristics, is used in durable goods applications (cars, interiors, furnishings, etc.). The material’s properties ensure a fairly long-life cycle, delaying replacement and end-of-life. This aspect represents a positive characteristic in terms of circular economy and benefits the end user. Regarding the production process, the use of polymers from recycling (R-PET), as a substitute for virgin raw materials, can reduce dependence on other types of polymers, bringing environmental benefits (including decarbonisation). Another positive impact derives from the recovery of waste and the commercialisation of by-products for different markets (Alcanol and Alcaren). In terms of risks for the Company, it should be noted that potential fluctuations in the price of strategic raw materials or their scarcity could cause an increase in procurement costs. IMPACTS, RISKS, AND OPPORTUNITIES	GRI / ESRS DISCLOSURE	POLICIES, INITIATIVES AND ACTIONS	SECTION
The risk of accidents, harming the health and safety of all personnel and collaborators, cannot be completely eliminated but is kept very limited thanks to careful management. Furthermore, from the Company’s perspective, implementing adequate safeguards and management systems represents an opportunity to reduce exposure to reputational damage and sanctions. Impacts related to employment stability and economic security, without discrimination, are crucial. Although the objective possibility of causing harm to many employees remains a negative impact that cannot be ruled out, the Company is committed to reducing job insecurity for all personnel, even during difficult periods. Furthermore, Alcantara creates significant positive impacts by continuously investing in employee training, lifelong learning, and skills development, which directly enhances professional growth, long-term employability, and operational productivity. Crucially, the active promotion of an inclusive, diverse, and equitable working environment enables employees to fully express their unique potential, turning Diversity, Equity, and Inclusion (DE&I) into a strategic driver of corporate innovation and talent retention. Value chain workers			
IMPACTS, RISKS, AND OPPORTUNITIES	GRI / ESRS DISCLOSURE	POLICIES, INITIATIVES AND ACTIONS	SECTION
The selection of partners for the supply of products, raw materials, and services represents an opportunity for the Company to demonstrate its commitment to sustainability across the upstream value chain. Through robust and proactive supplier qualification, evaluation, and continuous monitoring procedures, the Company identifies and prioritises partners aligned with Alcantara's ESG commitments, thereby generating a positive impact on systemic working conditions, health and safety, and human rights. Conversely, ineffective oversight or an inadequate selection process could lead Alcantara to inadvertently contribute to negative practices along the value chain, such as human rights violations or substandard health and safety conditions. From a risk perspective, inadequate supply chain management exposes the Company to reputational damages, legal sanctions, and severe operational disruptions. These risks are further amplified by geopolitical and economic instability or over-dependence on strategic suppliers. However, mitigating these factors through enhanced governance opens up significant strategic opportunities to build long-term supply chain resilience, secure business continuity, and strengthen brand equity among global stakeholders. Consumers and End Users			
IMPACTS, RISKS, AND OPPORTUNITIES	GRI / ESRS DISCLOSURE	POLICIES, INITIATIVES AND ACTIONS	SECTION
Impacts related to end users are primarily linked to product quality, safety, and chemical compliance, ensuring that Alcantara materials present zero health risks across all consumer segments. Alcantara also believes it is essential to maintain transparent, direct, and comprehensive communication regarding its sustainability performance and product lifecycle information. In an era of heightened regulatory scrutiny and consumer awareness, failing to do so could result in severe negative impacts on consumer rights and public health. In terms of risks and opportunities, poor communication management—such as misleading profiles or unsubstantiated green claims (greenwashing)—could result in considerable reputational damage, regulatory penalties, and loss of market share. Conversely, Alcantara capitalises on the opportunity to strengthen customer and consumer trust through rigorous, science-based, and third-party verified communication, transforming transparency into a driver for long-term customer loyalty. Governance			
IMPACTS, RISKS, AND OPPORTUNITIES	GRI / ESRS DISCLOSURE	POLICIES, INITIATIVES AND ACTIONS	SECTION
The lack of a robust governance system attentive to sustainability issues can result in negative impacts on people and the environment within the Company’s boundaries, leading to compliance failures and systemic inefficiencies. Additionally, the absence of appropriate internal controls may contribute to the spread of unethical and non-compliant practices throughout the value chain. Conversely, by establishing rigorous oversight and oversight bodies, Alcantara leverages its strong commitment to promoting virtuous practices and solid ethical principles across the supply chain. This approach helps raise market awareness on ESG issues, driving systemic industry progress and reinforcing the Company’s license to operate. Impacts, risks and opportunities

Alcantara depends heavily on energy (electricity and natural gas), which strains local supply and drives Scope 1, 2 and 3 GHG emissions; risk lies in energy price volatility raising production costs, while the opportunity comes from energy efficiency and renewables, which unlock tax incentives and strengthen the Company’s sustainability reputation.

Production requires hazardous solvents (DMF, TCE), impacting water bodies, ecosystems and people if safeguards fail; the risk is potential regulatory restriction or market shift toward solvent-free products, while the opportunity lies in R&D to replace these solvents with safer alternatives.

The Nera Montoro site sits in a water-stressed area, so high water consumption risks worsening availability for the local community and ecosystems.

On materials, Alcantara’s long product lifecycle supports circularity (positive impact), while waste generation is

the main negative impact; R-PET use reduces reliance on virgin polymers with decarbonisation benefits, and by-product sales (Alcanol®, Alcarene®) generate extra revenue — though price fluctuations or scarcity of strategic raw materials remain a cost risk.

2.1 CLIMATE
CHANGE AND
CARBON
MANAGEMENT

Historically, Alcantara first obtained a carbon neutral certification in 2009, issued by TÜV SÜD, according to their internal standard CMS Standard GHG41.

From 2014 onward, on an annual basis, the Company obtained the Carbon Neutral certification according to PAS 2060, as applicable at the time. Starting from 2025, the Company has complied with the new ISO 14068 standard becoming the first company in Europe verified to ISO 14068-1 for Carbon Neutrality by TÜV SÜD.

Alcantara's Carbon Neutrality pathway is founded on the prioritisation of direct emissions reductions, in accordance with ISO 14068-1:2023. Mitigation measures have been selected based on their technical feasibility, environmental integrity, and expected contribution to the achievement of the Company's medium- and long-term climate objectives.

To establish a science-aligned decarbonisation plan, Alcantara has identified a set of emissions reduction measures, categorised into internal and external levers. In addition, Alcantara has defined specific levers for its suppliers (Supplier Target).

Internal levers consist of actions that are initiated and directly managed by the Company to reduce its greenhouse gas (GHG) emissions.

External levers, by contrast, represent expected emissions reductions arising from changes beyond the Company's direct control. These reductions are nonetheless incorporated into planning activities through recognised forecasting scenarios and regulatory developments.

In line with its Carbon Neutrality commitment and as an integral part of its management plan under ISO

14068-1:2023, Alcantara has established a structured compensation strategy as further detailed below.

Of course, the most important action a company can take to combat climate change is to reduce its own carbon footprint within its value chain. But purchasing carbon credits is not separate from this strategy; it is a key part of it.

Purchasing carbon credits allows businesses to support climate action projects that might otherwise lack adequate financing. These climate action projects not only reduce emissions but also offer a host of social benefits such as improved health, better education, and the building of sustainable communities.

Worldwide, certified climate action projects reduce or avoid greenhouse gas emissions generating emission

savings that translate into “carbon credits”: each credit is a certificate with a unique serial number, attesting that 1 metric ton of carbon dioxide equivalent (1 tCO₂e) has been avoided or reduced. Companies can then purchase these carbon credits to offset a number of emissions equivalents to their unabated emissions. Each carbon credit is stored in a public registry; as soon as it is sold, it is removed (or “retired”) to reduce the likelihood of double counting. Carbon credits have undergone rigorous verification: this is because the project they come from is registered with world-class verification standards, such as the Clean Development Mechanism, Verra, or the Gold Standard. These standards set strict criteria and organise independent reviews to examine the project, ensuring that the carbon reduction is permanent and additional to what would happen without the project’s existence.

In the longer term, consistent with its Carbon Management Plan according to ISO 14068-1, Alcantara will not only offset residual emissions but will eventually neutralise (i.e., offset through credits specifically attesting to carbon removal actions from the atmosphere) all remaining residual emissions by 2050.

Climate change policies

Alcantara has implemented a comprehensive Health, Safety, and Environmental (HSE) Management System, guided by its HSE Policy and aligned with the principles of ISO 14001 standard. This system supports the Company’s commitment to environmental protection and continuous improvement in sustainability performance. The Company has obtained certification for its Product Carbon Footprint Systematic Approach Management System in accordance with ISO 14067:2018 Annex C. In addition, Alcantara’s Corporate GHG Inventory has been verified in accordance with ISO 14064-1, while its Carbon Neutrality approach has been assessed against the requirements of ISO 14068. Moreover, Alcantara has established emissions reduction targets aimed at achieving alignment with the requirements of the Science Based Targets initiative (SBTi) Indeed, our Company postponed to the next Fiscal Year its plan to officially commit to SBTi¹³.

These certifications, together with the ISO 14001 certification and the ISO 50001 Energy Management System certification, which the Company has maintained since 2017, reinforce Alcantara’s environmental management framework and support the achievement of its sustainability objectives.

All Company policies, including those related to environmental matters, are formally approved by the Chief Executive

Officer, ensuring alignment with strategic objectives and accountability at the highest level of governance.

13. Alcantara has defined internal reduction goals aligned with SBTi criteria and plans to submit them to SBTi for validation by December 2026.

Alcantara’s transition plan for climate change mitigation¹⁴

Alcantara has been developing a comprehensive decarbonisation plan aligned with the **ISO 14068-1:2023 standard**. The Company has set ambitious climate targets for **2030**:

- a short-term absolute reduction of 37,8% in Scope 1 and Scope 2 emissions by 2030, corresponding to an average annual reduction rate of at least 4.2%;
- for Scope 3 emissions Alcantara has adopted a target to reduce emission intensity by at least 7% per year per linear meter of Alcantara product by 2030, covering at least 67% of total indirect emissions along the value chain.

(Baseline: Fiscal Year 2021–2022)

These intermediate targets are intended to support the Company’s pathway

towards a net-zero objective by 2050, as set out in the Carbon Management Plan.

To meet these targets, Alcantara has implemented a set of actions across internal operations, supplier engagement, and external scenario planning, detailed in its **Carbon Management Plan**, updated annually.

The emissions reduction achieved is in line with the annual target for **Scope 1** and **Scope 2** (-5% vs. target). For **Scope 3**, however, the reduction achieved falls short of the annual target (+23% vs. target) set out in the Carbon Management Plan. This is attributable both to changes in the production setup compared with the budget assumptions and to delays in the implementation of certain projects, as well as to the significant changes in the broader socio-economic context.

¹⁴.
As of 31 March 2026, Alcantara is finalizing the feasibility assessments of the Transition Plan.

Targets

Decarbonisation targets form the basis of the Company’s “Carbon Neutrality Management Plan,” ensuring that emission reductions are always prioritised over offsetting measures.

Consistent with the SBTi criteria, starting from the 2021 base year, Alcantara has defined a progressive reduction path for its greenhouse gas emissions. This path includes a short-term absolute reduction of 37,8% in Scope 1 and Scope 2 emissions (categories 1 and 2 of the inventory according to ISO 14064) by 2030, corresponding to an average annual reduction rate of at least 4.2%, in line with the SBTi trajectory for the 1.5°C scenario. Furthermore, for Scope 3 emissions (categories 3-6 of the inventory according to ISO 14064), Alcantara has adopted a target to reduce emission intensity by at least 7% per year per linear meter of Alcantara product by 2030, covering at least 67% of total indirect emissions along the value chain.

These intermediate targets are intended to support the Company’s pathway towards a net-zero objective by 2050, as set out in the Carbon Management Plan. To reach this goal, Alcantara has adopted the following long-term targets: an absolute reduction of 90% in Scope 1 and Scope 2 emissions; for Scope 3 emissions, a reduction in emission intensity of 97% per linear meter of Alcantara product, covering a minimum of 90% of the base year’s Scope 3

emissions. Alcantara has developed its decarbonisation pathway following the principles and criteria required by SBTi, specifically:

Minimum requirements considered by Alcantara for formulating its targets according to SBTi Net-Zero criteria

	Scope 1+2	Scope 3
TARGET BOUNDARY	>95% of Scope 1+2 emissions	> 67% of Scope 3 emissions by 2030 > 90% of Scope 3 emissions by 2050
LEVEL OF AMBITION	Aligned to 1,5°C	Aligned to Well-Below 2°C by 2030 Aligned to 1.5°C by 2050
TARGET TYPE	Absolute emissions	Physical intensity (Specific emissions per linear meter of product produced in the inventory period)
REQUIRED REDUCTION	-37.8% reduction by 2030 -90% reduction by 2050	-51.60% reduction by 2030 -97% reduction by 2050

Reduction strategies and results achieved in the reporting year

The core of Alcantara’s Carbon Neutrality journey is the prioritisation of direct emission reductions; a strategy aligned with the principles of ISO 14068-1:2023 and consistent with the SBTi Net-Zero framework. Each mitigation measure

is selected for its technical feasibility, environmental integrity, and its projected contribution to our medium and long-term climate goals.

To build a science-aligned decarbonisation plan, we have adopted a range of reduction initiatives spanning internal operations, external actions, and targeted supplier engagement.

These measures are detailed in the Company’s Carbon Management Plan,

which is reviewed and updated annually. Key actions from the current reporting period include:

External levers, on the other hand, represent expected reductions that derive from changes outside the Company’s direct control but are considered in planning through forecast scenarios or recognised regulatory developments.

Since these levers essentially contribute to a forecast figure, a numerical contribution in terms of actual reductions is not directly attributable to the reporting year.

Set of internal levers implemented or to be implemented to constitute Alcantara’s emission reduction plan

ISO 14064 CATEGORY	REDUCTION MEASURE	TYPE	QUANTIFICATION OF EMISSION REDUCTION
Cat. 1 - Direct emissions	Use of biomethane to replace natural gas	Internal	For Fiscal Year 2026, Alcantara purchased biomethane certificates for a total quantity of 7,169,000 kWh.
Cat. 1 - Direct emissions	Conversion of the Company fleet to hybrid and electric vehicles	Internal	Alcantara has continued the transition of its fleet to hybrid and electric vehicles. To date, 9% of the fleet consists of EVs and 65% of PHEVs
Cat. 1 & 2 - Direct emissions and from imported energy	Energy efficiency of production processes (water, steam)	Internal	During the 2025–26 financial year, there was a decrease in specific electricity consumption (-5%) and steam consumption (-3.5%) compared with the previous year.
Cat. 2 - Em. from imported energy	Maintaining 100% electricity purchases with Guarantees of Origin	Internal	Zero emissions Category 2 (market-based approach)
Cat. 3 - Em. emissions from transportation	Carpooling incentives for employees	Internal	Between 1 December 2023 and 31 March 2026: 116,311 km travelled via carpooling
Cat. 4 - Em. from products and services	Increased use of recycled polyester to replace virgin	Internal	In Fiscal Year 2026, the use of R-PET in spinning was equal to 18.5% of total polyester consumption, compared to a percentage of 15.6% in the previous year.
Cat. 4 - Em. from products and services	Self-production of nitrogen (technical gases) for energy saving	Internal	Supply contract finalised. Benefits expected in the next financial year.
Cat. 4 - Em. from products and services	Top 10 suppliers reach 100% renewable electricity	Target Suppliers	Alcantara has launched a request for the use of renewable electricity for its top 10 suppliers.

Key Performance Indicators

Cogeneration and trigeneration plants

Since 2013, thanks to a contract with the Company ENGIE, Alcantara has operated a cogeneration plant for the supply of electricity and steam, recognised by the GSE (“Gestore dei Servizi Energetici”, namely “National Energy Services Manager”) as a high-efficiency cogeneration plant within a User Efficiency System.

The first cogeneration plant, operated under a long-standing contract with ENGIE since 2013, is capable of supplying steam with a maximum contractual capacity of 48 tons per hour (t/h) and generating up to approximately 50,000 megawatt-hours of electricity per year (MWh/year).

In 2019, following an increase in energy consumption due to higher production levels, the Company expanded the plant’s capacity by installing a trigeneration unit to ensure the continued availability of electricity within the facility. This expansion led to significant cost savings and reduced the environmental impact of production. Finally, in the first quarter of 2025, a new cogeneration plant was installed, matching the production capacity of the one installed in 2013.

In Fiscal Year 2026, the cogeneration and trigeneration plants supplied 177,663 MWh of thermal steam and 65,762 MWh of electricity, generating significant energy, environmental, and economic benefits.

Specifically, the first cogeneration system reduced primary energy consumption by approximately 5,134 tonnes of oil equivalent (toe) per year.

The following table, which reports data on a calendar-year basis, quantifies the actual benefits derived from the cogeneration system, including:

- **High energy efficiency** enabled by next-generation technologies;
- **Simple heat recovery** cogeneration of approximately 13 t/h (zero-cost steam generated from hot exhaust gases from the gas turbine);
- **Energy efficiency certificates** (so-called “white certificates”);
- **Tax incentives** for natural gas supplied to HEC-qualified power stations;
- **Significantly lower energy bills** from an economic standpoint;
- **Greater energy independence and supply reliability;**
- **No capital investment required** for the construction of the plant, allowing funds to remain available for the Company’s core business.

BENEFITS OF COGENERATION	UM	2017	2018	2019	2020	2021	2022	2023	2024	2025	Total
Amount of gas saved	MWh	66,329	71,018	66,030	53,512	63,152	64,913	64,586	56,397	43,052	549,989
	TOE	5,704	6,108	5,679	4,602	5,431	5,583	5,554	4,850	3,702	47,213

The trigeneration plant, commissioned in 2019, has an annual production capacity of **21,050 MWh** of electricity, **10,697 MWh** of cogenerated thermal energy (produced without additional fuel input), and **8,174 MWh** of cooling energy.

In the 2025 Calendar Year, compared to the separate production of electricity, heat, and cooling, the trigeneration system allowed the Company to avoid **198 tonnes of CO₂ emissions and to save 967 MWh of energy.**

Over the past seven years, the plant has enabled the generation of approximately **1,114 Energy Efficiency Certificates (EECs)** per year.

In the 2025 Calendar Year, the second cogeneration plant allowed the Company to avoid **4,225 tonnes of CO₂ emissions** and to save **20,667 MWh of energy.**

TRIGENERATION PLANT	UM	2023	2024	2025
Natural gas saved	MWh	9,844	11,028	967
	TOE	847	948	83
CO ₂ avoided	TONS	2,003	2,252	198

2 nd COGENERATION PLANT	UM	2025
Natural gas saved	MWh	20,667
	TOE	1,777
CO ₂ avoided	TONS	4,225

Photovoltaic plants

The photovoltaic system (PV), installed at the Milan headquarters in Fiscal Year 2023, produced **90.8 MWh** of electricity in Fiscal Year 2026, **90%** of which was used for self-consumption and **10%** fed back into the grid. This allowed the site to cover **20%** of its electricity demand with self-produced renewable energy.

Additionally, the photovoltaic system at Nera Montoro produced 294 MWh of electricity, of which 57% were self-consumed.

Energy consumption

Energy consumption recorded in the commercial and administrative offices at the Milan headquarters is related for the most part to the use of:

- natural gas for heating room;
- electricity for normal office activities, cooling rooms, and the operation of the heating plant.

The Nera Montoro production site, on the other hand, consumes:

- natural gas for direct heating, to produce steam at a pressure of 6 bar, and for the canteen;
- steam at a pressure of 6 bar, guaranteed by the cogeneration plants and the trigenerator inside the plant;
- electricity, mainly used for the production process;
- diesel fuel.

ALCANTARA

ENERGY CONSUMPTION	UM	FY 2024	FY 2025	FY 2026
ENERGY CONSUMPTION FROM NON-RENEWABLE SOURCES (excluding Cogeneration plant)				
Natural Gas	TJ	78.17	65.40	59.42
Of which: for heating	TJ	0.28	0.99	0.75
Of which: for the production plant	TJ	77.89	64.42	58.67
Diesel	TJ	1.86	1.80	1.49
Of which: for business travel by Company cars	TJ	1.70	1.66	1.31
Of which: for production processes	TJ	0.16	0.14	0.18
ENERGY CONSUMPTION FROM ELECTRICITY				
Electricity	TJ	88.50	61.62	23.33
Of which: purchased	TJ	88.03	60.78	22.43
Of which: self-produced from photovoltaic plant	TJ	0.47	0.84	0.90
ENERGY CONSUMPTION FROM COGENERATION PLANT (Gas generated energy)				
Total energy consumption from cogeneration plant	TJ	1,012.91	913.49	876.33
Of which: electricity	TJ	234.76	225.46	236.74
Of which: steam	TJ	778.15	688.03	639.59
TOTAL ENERGY CONSUMPTION	TJ	1,181.44	1,042.32	960.57

From 2025 to 2026 there was a **7.84% decrease in total energy consumption**, from 1,042.32 TJ in 2025 to 960.59 TJ in 2026. The total amount of electricity purchased from renewable sources in Fiscal Year 2026, certified with Guarantees of Origin, was **6,231.04 MWh (22.43 TJ)**, broken down as follows:

ELECTRICITY PURCHASED FROM RENEWABLE SOURCES (TJ)	UM	FY 2024	FY 2025	FY 2026
Renewable energy purchased and covered by Guarantee of Origin	TJ	88.03	60.78	22.43
Photovoltaic	TJ	0.00	1.46	0.00
Wind	TJ	85.39	52.88	0.98
Hydropower	TJ	2.64	1.08	6.69
Biomass	TJ	0.00	5.35	0.00
Geothermal	TJ	0	0	14.76

Alcantara's total self-produced renewable energy in Fiscal Year 2026 amounted to **386.48 MWh**, with **250.40 MWh (65%)** consumed for its own operations and 136.08 MWh (35%) **sold externally**.

GHG emissions

In Fiscal Year 2026, the Company’s inventory of direct and indirect GHG emissions was prepared in accordance with the guidelines of the UNI ISO 14064-1:2019 standard and verified by TÜV SÜD. The results, expressed in tons of CO₂ equivalent, are summarised in the table below, compared with the previous years, starting from the baseline.

ALCANTARA

GHG EMISSION (tonCO ₂ e) (market based)	FY 2022 (baseline)	FY 2024	FY 2025	FY 2026
Scope 1 – Direct GHG emissions	71,495.24	70,272.48	63,934.42	56,800.94
Scope 2 – Indirect GHG emissions (market based)	38.20	0.00	15.17	0.00
Scope 3 – Other indirect GHG emissions	97,361.39	92,120.69	79,549.67	70,917.25
Indirect GHG emissions from transportation	5,473.46	6,148.18	4,925.06	4,604.30
Indirect emissions from products used by the Organisation	85,112.13	82,642.83	71,578.46	63,486.40
Indirect emissions associated with the use of the Organisation’s products	5,806.52	2,229.5	2,185.50	2,171.21
Indirect GHG emissions from other sources	969.28	1,100.18	860.65	655.34
TOTAL GHG EMISSIONS (Scope 1 + Scope 2 + Scope 3)	168,894.83	162,393.17	143,499.26	127,718.19

GHG EMISSION (tonCO ₂ e) (location based)	FY 2022 (baseline)	FY 2024	FY 2025	FY 2026
Scope 1 – Direct GHG emissions	71,495.24	70,991.28	64,831.25	58,307.21
Scope 2 – Indirect GHG emissions (location based)	6,105.93	6,301.33	4,350.61	1,887.25
Scope 3 – Other indirect GHG emissions	98,187.33	94,238.43	80,600.38	70,502.62
Indirect GHG emissions from transportation	5,473.46	6,148.18	4,925.06	4,604.30
Indirect emissions from products used by the Organisation	84,714.52	82,498.02	71,174.58	63,239.87
Indirect emissions associated with the use of the Organisation’s products	5,315.58	1,973.45	1,904.88	1,650.94
Indirect GHG emissions from other sources	2,683.77	3,618.78	2,595.86	1,007.51
TOTAL GHG EMISSIONS (Scope 1 + Scope 2 + Scope 3)	175,788.50	171,531.04	149,782.25	130,697.08

In the Fiscal Year 2025, the boundaries of the GHG inventory were expanded to include certain subcategories within categories 3, 4, and 6 that had previously been excluded. To ensure a consistent assessment over time, data for the baseline and subsequent years have been internally recalculated using standardised methodologies and category classifications, in accordance with ISO 14064 and ISO 14068. In the Fiscal Year 2026 the Ecoinvent v3.11 secondary dataset has been used for the calculation of Fiscal Year 2026 and the recalculation Fiscal Year 2022.

GHG Emissions in the Base Year (Baseline)
The base year for Alcantara’s Carbon Neutrality journey is the period between April 2021 and March 2022. During this period, total greenhouse gas emissions, calculated in accordance with ISO 14064-1, amounted to 168,895 tCO₂e.

Reductions Achieved and Unabated Emissions
In the reporting period April 2025 – March 2026 (Fiscal Year 2026), Alcantara’s total GHG annual emissions amount to 127,718 tCO₂e. Comparing this figure with the base year’s emissions of 168,895 tCO₂e, a reduction of 41,177 tCO₂e has been achieved to date. Our current emissions remain above our long-term target for residual emissions (21,432 tCO₂e by 2050). The difference, 106,286 tCO₂e, represents the unabated emissions that our decarbonisation pathway is designed to eliminate in the coming years.

Offsetting greenhouse gases

In line with its commitment to Carbon Neutrality and as an integral part of its management plan under ISO 14068-1:2023, Alcantara has defined a structured offsetting strategy to address both unabated and residual GHG emissions that cannot be eliminated during the reference period.

- **Residual emissions** are those that cannot be eliminated with currently available or economically accessible technologies, meaning they are present even after all possible reduction and removal measures have been implemented.
- **Unabated emissions** are all emissions not yet reduced or removed in the considered period, but which are expected to be completely eliminated by the end of the implementation period of all reduction levers, net of residual emissions.

Offsetting is applied exclusively to unabated and residual emissions, following the Company’s decarbonisation hierarchy, where internal emission reductions and removals always have priority. The offsetting strategy reflects the Organisation’s intention to maintain a state of Carbon Neutrality during the

transition to deep decarbonisation and, ultimately, the achievement of net-zero emissions status.

Alcantara’s offsetting strategy is based on the principles of ISO 14068. This standard sets out the requirement to ensure the quality and integrity of the emission reductions used to generate carbon credits. This approach guarantees that the credits are real, measurable, additional, permanent, and verified by third parties, and that the carbon crediting programmes ensure maximum transparency through public registries to prevent double counting. The Gold Standard and VCS certified credits, specifically used for offsetting in the FY25-26 reporting year, are subject to stringent integrity requirements according to the principles expressed in the reference documentation published by the entities themselves (respectively https://globalgoals.goldstandard.org/standards/101_V2.1_PAR_Principles-Requirements.pdf and <https://verra.org/wp-content/uploads/2023/08/VCS-Program-Guide-v4.4.pdf>).

During Fiscal Year 2026, Alcantara continued to strengthen supplier engagement within its climate management strategy, expanding the number and categories of suppliers involved in greenhouse gas emissions quantification and in actions supporting the management of residual emissions. As part of this approach, several suppliers voluntarily purchased verified carbon credits corresponding to the share of emissions associated with products and services supplied to Alcantara.

ALCANTARA

For the Fiscal Year 2025-2026, the amount of emissions offset by suppliers is 11,642,000 kgCO₂e.

To offset the quantity of unabated and residual emissions in the reporting year, net of emissions already traceably offset by suppliers for the same period, Alcantara is purchasing the following quantity of carbon credits for the year 2025-2026:

Total Alcantara Market Based FY 25-26 (kgCO ₂ e)	127,718,194
Suppliers Compensation (kgCO ₂ e)	11,642,000
Compensation by Alcantara (kgCO ₂ e)	116,076,194

The credits acquired during Fiscal Year 2026 are linked to the generation of electricity from hydropower, wind, and solar energy. These initiatives resulted in the offsetting of a total of 116,077 tonnes of CO₂ equivalent.

Breakdown of Alcantara’s Offsets

The offsets managed by Alcantara have been allocated to the following projects, exclusively selected from projects certified by VCS or Gold Standard.

Wind Power project in Jamnagar Gujarat The project activity involves the establishment of a wind farm of 105 MW installed capacity enabling generation of electricity by state-of-art 2 MW capacity Wind Turbine Generators (WTGs) (one of the latest available technologies in the country developed by Vestas wind in the state of Gujarat. The electricity generation from this wind farm contributes to annual GHG reductions estimated at 213,365 tonnes of carbon dioxide equivalent). The project activity is expected to evacuate approximately 227,760 MWh of renewable power annually to the Central Grid of the country. In the absence of the project activity, the accordant amount of electricity would have been delivered through the grid, which to a large extent is fed by fossil sources, leading to carbon dioxide emissions.	Energising India using Solar Energy Projects The proposed project activity is a step towards supporting the implementation and installation of grid connected renewable solar energy power plants in India. The main goal of project activity is to implement renewable energy projects in the country and the significant importance of revenues from sale of Verified Carbon Units (VCUs) to achieve this goal forms the basis of the implementation of this project activity. The project activity is a voluntary action and each SPV will be the Project Proponent for their project activity. Azure Power India Pvt Ltd as a parent company formed different SPVs (Special Purpose Vehicles) for solar projects and projects are developed by name of SPVs. The total AC capacity of the project activity is 416.9 MW and the power produced displaces an equivalent amount of power from the activity will be 684,229 tonnes of CO₂e and total GHG emission reductions for the chosen 10-year crediting period will be 6,842,290 tonnes of CO₂e.
Alkumru Hydroelectric Power Plant The Alkumru Hydroelectric Power Plant project is located at the Eastern Anatolia Geographical district of Turkey over the Botan River that is one of the major tributaries of the Tigris. The Alkumru HPP will be producing electricity by utilizing the energy of the Botan river, a major tributary to River Tigris. Energy will be produced using the head difference between the 647 m maximum water level and 541.80 m tail water levels. With the latest design updates the project is expected to produce an annual amount of 881,210 MWh of electricity. This accounts for 475,143 tonnes of VCUs per year.	Ghani Solar Renewable Power Project The main purpose of this project activity is to generate a clean form of electricity through renewable solar energy sources. The project activity involves installation of a 500 MW solar power project in Andhra Pradesh state of India. Over the 10 years of first crediting period, the project will replace anthropogenic emissions of greenhouse gases (GHG’s) estimated to be approximately 887,800 tCO₂e per year, thereon displacing 919,800 MWh/year amount of electricity from the generation-mix of power plants connected to the Indian grid, which is mainly dominated by thermal/ fossil fuel based power plant.
Fajina Geothermal Based Space Heating System According to the requirements of the above Plan, Zhengzhou municipal government will take a series of measures to improve the environment and residents’ living conditions. The project activity is designed to introduce geothermal energy-based space heating system to realise heat supply to a series of new residential buildings in Zhengzhou city over winter season, which will displace heat supply from isolated coal-fired boilers as a business-as-usual scenario in the project area. The project can supply geothermal heat to 8,813 thousand m2 of newly built residential buildings with a total heating load of 440.65 MW. Emission reduction credits will be earned using geothermal energy instead of the combustion of fossil fuel for space heating.

Carbon Neutrality
under ISO 14068:
methodology for
quantifying direct and
indirect GHG emissions

For the definition of the Company’s organisational boundaries, the “control approach” is applied. According to this approach, the Organisation accounts for 100% of the greenhouse gas emissions and/or removals related to operations and facilities/plants over which it has financial or operational control.
The Organisation comprises two sites:

- The production site is in Narni (TR), Nera Montoro, where the entire production process takes place, and the Research Centre is located;
- The commercial/administrative offices in Milan (Via Mecenate, 86), which house the Company’s management and where commercial, logistical, and market support activities are located, as well as the human resources and finance and control departments.

These sites have been identified by the type of activity (production and commercial/administrative) over which the Organisation exercises control for the accounting of the greenhouse gas emissions inventory. The GHG inventory is prepared each Fiscal Year according to the EN ISO 14064-1:2019 standard “Specification with guidance at the

organisation level for quantification and reporting of greenhouse gas emissions and removals”.

Baseline and
Reference Period

Although reliable data for emissions calculation has been available since 2009, the latest update of the Company’s decarbonisation plan identified the Fiscal Year from April 2021 to March 2022 as the reference year for measuring the effectiveness of future decarbonisation actions. The results for this year were disclosed in the 2022 Sustainability Report.
In that base year, total greenhouse gas emissions were quantified at 168,895 metric tons of CO₂ equivalent (tCO₂e). On this basis, the Company has defined a medium-term target for 2030 and a long-term (Net-Zero) target for 2050, aligning with the principles of the Science Based Targets initiative (SBTi).
This was in consideration of two macro-factors that significantly influenced the Company’s activities:

- The pandemic emergency, which in 2020 significantly affected the Company’s business scenario;
- The completion of the main steps of a five-year investment plan aimed at increasing production capacity and industrializing a new, water-based process.

The Company’s production volumes growth projection makes the choice of a base year particularly challenging.

Despite this expected growth, Alcantara is committed to implementing measures aimed at reducing total Scope 1 and 2 emissions and substantially lowering the specific emissions of other categories (3-6).

To ensure a consistent assessment over time, data for the baseline and subsequent years have been recalculated using standardised methodologies and category classifications, in accordance with ISO 14064 and ISO 14068. The ecoinvent v3.11 secondary dataset has been used for all calculations to guarantee comparability.

GHG inventory –
methodology used

The GHG inventory calculation has considered carbon emissions in the scopes provided by the ISO 14064:2018 standard. The calculation study is implemented annually and was carried out using SimaPro software, with the SimaPro v10.2, in line with the EN ISO 14064-1:2019 standard and the ISO 14040/14044 series of standards.

According to EN ISO 14064-1:2019, the emissions reported within a corporate Carbon Footprint are divided into the following categories:

- **Category 1:** Direct emissions from sources owned or controlled by the Organisation.
- **Category 2:** Indirect greenhouse gas emissions associated with the production and consumption

of energy imported by the Organisation.

- **Category 3:** Indirect greenhouse gas emissions from transport.
- **Category 4:** Indirect greenhouse gas emissions from products used by the Organisation.
- **Category 5:** Indirect greenhouse gas emissions associated with the use of products from the Organisation.
- **Category 6:** Indirect greenhouse gas emissions from other sources.

The analysis is presented as a partial corporate Carbon Footprint and includes direct emissions (Category 1), indirect emissions from imported energy produced through combustion (Category 2), indirect emissions from transport (Category 3), indirect emissions from products used by the Organisation (Category 4), indirect emissions associated with the use of products from the Organisation (Category 5), and indirect emissions from other sources (Category 6). Excluded, as indicated by the significance analysis, are emissions from “Category 3 - Customer and visitor travel,” “Category 4 - Milan waste,” “Category 5 - Leased assets,” and “Category 5 - Investments.”

Alcantara is committed to ensuring the compliance and transparency of its greenhouse gas emissions inventory by subjecting it to annual verification by an independent third party according to the requirements of the ISO 14064-1 standard.

As of the approval date of this Sustainability Report, the compliance assessment with the standard was completed by TÜV SÜD in July 2026 and the final report is pending.

Assumptions, Data, Sources, and Emission Factors

The assessment is based on primary data sourced directly from Alcantara’s operations. This includes detailed energy consumption figures, such as natural gas for boilers, cogeneration, trigeneration, drying, and steam production, as well as diesel for backup generators and fire pumps, and fuel for the corporate fleet. The data also covers F-gas emissions and refills, grid electricity, water usage, and waste quantities. The analysis extends to logistics and value chain activities, incorporating data on employee commutes, business travel, purchased goods, product use, and outsourced processing. Information from key suppliers, customers, and waste treatment partners was also integrated. For all other processes, the study drew upon secondary data, primarily from the ecoinvent v3.11 LCA database.

Temporal Representativeness of the Most Recent Inventory Data (FY25-26)

The primary data used refers to the entire Fiscal Year (April-March) of the reference year. This period becomes the reference year as it is the time frame for which the Carbon Footprint is calculated. The secondary data used in the study come from the ecoinvent v3.11 database, published in 2024.

Geographical Representativeness of Data

Primary data are collected at Alcantara’s headquarters and production site, located in Milan and Nera Montoro (TR), respectively. The Company operates on a global scale, sourcing raw materials from international suppliers and distributing its products across Europe and the rest of the world.

Allocation Rules

For virgin resources, raw materials and production processes are included. No allocation is made for recycled materials. For the recycled resources input, the recycling process is included. Outputs subject to recycling are considered inputs for the next life cycle.

For data from the ecoinvent database, the “ecoinvent 3.11, allocation, cut-off by classification” database was selected, in line with the approach described above.

Environmental Impact Assessment Method

The Life Cycle Impact Assessment (LCIA) phase aims to aggregate and convert inventory results into their respective potential environmental impacts. The LCIA phase allows for associating inventory table data with environmental themes (impact categories) such as global warming, using impact indicators, and weighting and classification factors. The environmental impact assessment was conducted using the IPCC 2021 GWP 100a v1.02 method. This methodology

quantifies the contributions of all greenhouse gases specified in the EN ISO 14064 standard—including carbon dioxide, methane, nitrous oxide, sulfur hexafluoride, and nitrogen trifluoride—aggregating them into a single metric expressed in kg of CO₂ equivalent. Calculating our corporate carbon footprint is a cornerstone of our environmental strategy, providing the critical data needed to manage and improve our performance.

Cut-off rules and exclusions

In accordance with the EN ISO 14064-1 standard, a materiality assessment was performed on the indirect emission categories (Categories 2, 3, 4, 5, and 6) indicated in the standard. The criteria used for the significance analysis as indicated in the reference standard are:

- Magnitude. Indirect emissions/removals that are presumed to be quantitatively substantial.
- Level of influence. The extent to which the Organisation has the ability to monitor and reduce emissions/removals (e.g., energy efficiency, eco-design, customer engagement, in terms of reference).
- Risk or opportunity. Indirect emissions/removals that contribute to the Organisation’s risk exposure or business opportunities.
- Sector-specific guidance. Greenhouse gas emissions are considered significant by

- the business sector, based on specific guidelines/standards.
- Outsourcing. Indirect emissions/removals from outsourced activities are typical core business activities of the Organisation.
- Employee engagement. Indirect emissions that could motivate employees to reduce energy consumption or that allow for associating team spirit with climate change.
- Data availability. Availability of data from the Organisation.

Each criterion was weighted, and the significance score was calculated as a weighted average across all criteria for each category. It was decided to consider emissions with a score greater than 2.5 as significant. The significance analysis carried out based on the criteria listed above was divided according to the registered office and the production site, as the assigned scores can vary greatly between the two. Indirect emissions from imported energy (excluding electricity) are not present in the reference year of the analysis, for which reason the significance analysis is not applicable for this subcategory. Emissions from “Category 3 - Customer and visitor travel,” “Category 4 - Milan waste,” “Category 5 - Leased assets,” and “Category 5 - Investments” were excluded from the analysis due to the complexity of accessing the necessary information for quantification. It is assumed, however, that these emissions are not significant in relation to the Organisation’s total emissions.

Third party verification

The verification of the Carbon Neutrality declaration according to the ISO 14068-1:2023 standard was entrusted to TÜV SÜD Italia, which committed to observing the ethical and behavioral principles stated in the Code of Ethics, available at the link <http://www.tuv.it/it-it/chi-siamo/tuev-italia/codice-etico> adopted by TÜV Italia along with the Organisation and Management Model pursuant to Decree 231/01. As of the approval date of this Sustainability Report, the verification was carried out by TÜV SÜD in July 2026 and the final report is pending. The Carbon Neutrality Report for the current reporting year, prepared in accordance with the principles of ISO 14068 and verified by TÜV SÜD, is available in its full version upon request.

2.2 POLLUTION

Policies and commitments against pollution

As introduced in the previous sections, Alcantara renewed in 2025 the Environment, Health and Safety Policy²¹ which contains the main commitments towards environmental protection, safety and health. Concerning pollution, Alcantara’s commitment is currently focused on the elimination of hazardous substances from the production cycle and implementing a Chemical Management System in accordance with the **CHEM 4sustainability®** protocol, applicable to both the water-based and closed-loop solvent processes.

The **CHEM 4sustainability®** protocol is a structured methodology developed to support companies in the responsible management of chemicals throughout their production processes. It aligns with the goals of **ZDHC (Zero Discharge of Hazardous Chemicals)** and aims to eliminate or replace hazardous substances, ensuring safer and more sustainable chemical use. Over the years, Alcantara has implemented a series of concrete and voluntary actions aimed at reducing the use of hazardous substances, including:

- progressive replacement of SVHC substances, with particular focus on the phasing out of TCE (trichloroethylene) and DMF (dimethylformamide), in favour of water-based processes²²;
- recovery and closed-loop reuse of solvents still in use, ensuring the minimisation of emissions and worker exposure;
- application of Best Available Techniques (BAT) through a detailed analysis of production processes;
- treatment of industrial wastewater, including runoff from first rainfall events, before discharge into the surface water body (Nera River), which is located in a protected area, in compliance with the limits set by the Integrated Environmental Authorisation.

The Environment, Health and Safety Policy, which is communicated within the Organisation and made available to other interested parties, is applied through the definition of targets, the implementation of annual Operational Plans, and the deployment of Environmental and Health & Safety Management Systems, ensuring their widespread adoption at all levels of the Organisation.

Water based process

Since 2013, Alcantara has launched an innovative project internally referred to as “water-based”, introducing a production process based on alternative raw materials and low environmental impact technologies. The new system has enabled the elimination of TCE and DMF solvents, replacing them with water and reducing the energy demand of the production cycle. This new generation of “water-based” products is currently supplied to strategic customers in the automotive and consumer electronics sectors. Research and Development activities are still ongoing, with the aim of expanding the product range and increasing market penetration in other segments.

Water treatment initiatives

Phyto-treatment

Phyto-treatment allows for the use of plant systems to reduce or eliminate the transfer of sludge leachates from the internal landfill outside of the plant. The intervention allowed for an overall environmental improvement of the landfill area, by interrupting the cycle that leads to the production of waste and by opening new destinations for the biological sludge produced by the water treatment system. Over the years, the phyto-treatment plant has proven its usefulness with regard to its initial objectives, by managing sludge leachates in safe and legal conditions. Following a few adverse events (fungus and frosts), the full functionality of the vegetation was designed by the University of Tuscia preparing a replanting project, approved by the Umbria Region in 2022 and completed in May 2023.

Wastewater treatment plants

Since 2021, two plants have been in operation to treat dyeing machine effluents, with the aim of increasing the recovery and reuse of water in Alcantara’s processes. Following the construction of a plant to treat the separate water flows from the dyeing cycle—based on cutting-edge MBR (Membrane Bioreactor) technology—the Company also developed a plant for the treatment of wastewater from the greige process. This latter initiative is aimed at recovering and reusing the acid aqueous solution, following the separation of surfactants, leveraging the specific expertise and know-how developed in this area. The plant’s structure includes a combination of ultrafiltration and nanofiltration technologies, along with a physical pre-treatment section. The compact and highly automated system became operational in June 2023.

Key Performance Indicators

Uses of Raw Materials

Alcantara ensures that all raw materials used in the production process comply with the principles established by regulations.

The main auxiliary raw materials, such as certain thermoplastic polymers and finishing agents used, are treated, recovered, and reused in the production cycle or allocated to other industrial uses.

As previously mentioned, Alcantara intentionally uses the solvents TCE and DMF in the traditional production process. These solvents are included in the list of SVHC (Substances of Very High Concern) and are not used in the new water-based process. Most recently (November 5th, 2025), Decabromodiphenylethane (DBDPE, CAS No. 84852-53-9), already under observation in some regulatory areas, was added to the SVHC list: this substance is contained as active ingredient in the flame retardant formulation used for the production of the fire-resistant product range. Other SVHC substances are present as minor components in the raw materials or chemicals used in the process.

All the substances listed above were already in use at the time of the introduction of the SVHC classification. With the exception of DBDPE, which

is intentionally added, they do not remain in the finished product in quantities exceeding 0.1%, as verified during the annual renewal analysis of the STANDARD 100 by OEKO-TEX® certification. Consequently, no safety precautions are considered necessary for professional users nor for the final consumer, whose potential exposure is assessed to be negligible.

For the solvents intentionally used in their pure form, the safety measures adopted within the production site include, in addition to the closed-loop system already described in previous editions of the Sustainability Report, those prescribed by the **authorisation issued by ECHA for TCE and by REACH Annex XVII for DMF**.

For the DBDPE, specific information was given both to the subcontractor performing the flame retardant treatment process and to the customers purchasing the finished products in question. At the same time,

the switch to an alternative Halogen Free formulation, already undertaken in the previous years, has reached a significant percentage of the total flame retardant production volume and is still on going.

For substances present in formulations and used in the internal processes, the precautions adopted are evaluated and implemented by our competent functions, in line with the indications contained in the Safety Data Sheets of the formulations, prepared by suppliers in accordance with the CLP Regulation, which we constantly update.

The TCE and DMF solvents used in the production process are operated in a closed circuit, recovered, regenerated, and reused within the production cycle. In compliance with the **REACH Regulation**, Alcantara has been authorised by the European Commission for the use of TCE in its production process (closed system).

Cutting-edge high-technology treatment systems ensure that atmospheric emissions and worker exposure are far below the legal limits currently in force in Italy.

The operating conditions and risk management measures currently adopted at the Alcantara site have been deemed suitable to reduce direct worker exposure to TCE to a level considered negligible/acceptable/tolerable by major regulatory bodies. This is also confirmed by rigorous internal controls and medical monitoring procedures, external audits, and evaluations conducted by competent authorities.

For the general population, indirect environmental exposure is expected to be negligible. The final product contains neither TCE nor traces of it.

SUBSTANCES	CAS	EC	NOTES

Quality of industrial wastewater

The wastewater generated from the production process and internal operations, as well as the first rainfall from the loading/unloading area near the warehouse, is treated before discharge. The treated water is discharged through a single outlet into a surface water body, specifically the Nera River. This discharge point is located within the protected area of Lake San Liberato and, in addition to being authorised and monitored by Umbria Region is managed in compliance with legal requirements.

All parameters related to authorised discharges (including the presence of hazardous substances as per Table 5, Annex 5, Part III of Italian Legislative

Decree 152/06, as subsequently amended) are regularly monitored by qualified external laboratories, in accordance with the requirements of the Integrated Environmental Authorisation.

It is important to note that the quality parameters of the wastewater are well below the limits established by current legislation, maintaining values within a range assessed as safe. Moreover, acute toxicity tests performed on the wastewater consistently produced results below the legal thresholds. The table below shows the average values of the main pollutants with the greatest environmental impact, compared with the legal limits.

ALCANTARA

QUALITY OF INDUSTRIAL WASTEWATER DISCHARGE: ANNUAL AVERAGE VALUES OF MAIN POLLUTANTS (FY 2025-2026)												
PARAMETER	pH	Suspended Solids	BOD ₅	COD	Hexavalent Chromium	Nitrous Nitrogen	Ammoniacal Nitrogen	Total Surfactants	Nitrogen-Based	Chlorinated Solvents	Escherichia Coli	Acute Toxicity Test
UM	-	mg/l	mg/l	mg/l	mg/l	mg/l	mg/l	mg/l	mg/l	mg/l	UFC/100ml	
Legal Limits for discharge into surface water	5.5-9.5	80	40	160	0.2	0.6	15	2	0.1	1	5000	<= 50% tot
Average value from 2019–2020 analysis	8.15	9	4.3	<15	<0.03	0.04	<0.01	0.4	<0.1	<0.1	9.0	Acceptable
Average value from 2020-2021 analysis	7.69	2.1	<5	3.98	<0.01	<0.01	<0.01	0.2	<0.05	<0.5	0	Acceptable
Average value from 2021-2022 analysis	8.31	2.4	10.5	23.4	<0.01	<0.05	<0.01	0.46	<0.05	<0.5	0	Acceptable
Average value from 2021-2022 analysis	8.4	1.5	8.1	27.5	<0.01	<0.05	0.11	0.88	<0.05	<0.5	0	Acceptable
Average value from 2023-2024 analysis	7.3	7	17.8	79.6	>0.03	<0.02	0.36	1.1	<0.1	<0.1	8	Acceptable
Average Value from 2024-2025 analysis	8.3	13	10	47.1	<0.01	0.1	0.5	0.7	<0.005	<0.01	5	Acceptable
Average Value from 2025-2026 analysis	7.9	8	19.9	45.7	<0.03	<0.02	0.1	1.8	<0.1	<0.1	160	Acceptable

Other emissions

Atmospheric emissions from authorised emission points, such as stacks of abatement systems, extraction hoods, and other localised systems, are monitored in compliance with the requirements of the Integrated Environmental Authorisation.

The table below reports the annual emission values for three main pollutants: NOx (nitrogen oxides), VOCs (volatile organic compounds), and dust. Starting from the Fiscal Year 2023, the pollutant SO₂ has been replaced with the parameter “Dust,” as the latter has become more relevant following the commissioning of new plants in the greige department and the launch of specific projects aimed at reducing particulate emissions.

OTHER EMISSIONS ²³	UM	FY 2024	FY 2025	FY 2026
NOx (Nitrogen Oxides)	Kg	1,599	4,835	4,918
Dust ²⁴	Kg	680	968	1,294
VOCs (Volatile Organic Compounds)	Kg	4,716	6,515	7,781
TOTAL	Kg	6,995	12,318	13,993

23.
Annual values may vary from year to year, as the data are based on concentrations measured periodically (typically once a year), reflecting both plant operations and changes in production processes. Emissions are calculated using analysis certificates issued by qualified laboratories, which employ sampling and analysis methods recognised by regulations.
The accounting process is based on the processing of these analysis certificates, which serve as the primary source for environmental reporting. The collected data include concentration values, flow rates, and operating conditions at the time of sampling.

24.
For Fiscal Year 2025, the dust composition includes 1,169 kg of general dust and 126 kg of polyvinyl alcohol.

2.3 WATER

Policies and processes for water management

The primary source of water for the industrial operations at the Nera Montoro plant is the Nera River. River water is used for various purposes including firefighting, irrigation, sanitary and industrial purposes and is used above all in dyeing the finished product. The wastewater produced by these processes is then sent to an internal treatment plant. We are particularly careful with regard to the quantity of drinking water that is drawn from the municipal supply, in order to enable greater consumption by local communities and new production sites in the area.

Alcantara’s production site in **Nera Montoro** is located in a region identified as being subject to **high water stress**, making the **sustainable management of water resources** a critical environmental and operational priority. The site is highly dependent on local freshwater resources, with the **Nera River** serving as the **primary source of water** for its industrial operations. Other sources include

groundwater wells and limited volumes from the **Terni Province municipal supply**. The wastewater produced by these processes is then sent to an internal treatment plant. Acknowledging the potential risks to both the surrounding **ecosystem and local communities**, the Company has adopted a comprehensive approach to **water stewardship** aimed at preventing, mitigating, and managing adverse impacts. To this end, Alcantara has implemented **robust environmental management system**²⁵, including a certification under **ISO 14001**, which provides a structured framework for monitoring, evaluating, and continuously improving the environmental performance of its operations. This includes specific protocols for **water consumption, discharge quality, and emergency response**, ensuring that water-related risks are identified and addressed at every stage of the production process.

In particular, ISO 14001 supports the Company in:

- identifying and assessing **site-specific risks related with water** (both physical and regulatory),
- defining clear **objectives and targets** for water use efficiency and quality control,

- implementing **preventive measures** to avoid environmental degradation or community conflict,
- monitoring compliance with **local water regulations and ecosystem thresholds**.

In addition, a water reuse plant, located downstream of the wastewater treatment station, has been operational since January 2021. As of March 31, 2024, it has recovered 11,647 cubic meters of industrial water.

25. The ISO 14001-certified Environmental Management System applies to the entire operational perimeter of Alcantara S.p.A. All water management policies and related procedures are formally approved by the Chief Executive Officer (Amministratore Delegato), ensuring top-level oversight and alignment with the Company’s environmental objectives.

Key Performance Indicators

Water withdrawal, discharge and consumption

Overall, in Fiscal Year 2026, the amount of water withdrawn equalled **1,884,370 m³**. Additionally, the Company also supplied ENGIE with the industrial water necessary for steam production, totalling **277,489 m³**. The values in the table (both withdrawal and discharge) do not include the water managed by ENGIE’s Turbogas plant.

All water used by Alcantara is sourced from and discharged into areas classified as water-stressed. In Fiscal Year 2026, Alcantara discharged a total of 1,751,762 m³. Wastewater from the production process and on-site activities, as well as the first rainwater from the discharge area at the warehouse, is subject to purification. The treated water is delivered via a single discharge into a surface water body, namely the Nera River.

26.
The values of water withdrawal and discharge have been obtained through direct readings from water meters and are reported in cubic meters (m³).

ALCANTARA

WATER CONSUMPTION (m³) ²⁶	FY 2024	FY 2025	FY 2026
TOTAL WATER WITHDRAWAL	1,853,000	1,927,275	1,884,370
TOTAL WATER DISCHARGE	1,739,000	1,509,186	1,751,762
Aggregate Water Consumption	114,000	418,089	132,608

The allocation of water withdrawals by source is detailed in the following table:

WATER WITHDRAWALS BY SOURCE	UM	FY 2024	FY 2025	FY 2026
Surface water	MI	1,820	1,877	1,828
Groundwater	MI	31	46	50
Seawater	MI	-	-	-
Produced water	MI	-	-	-
Third-party water resources	MI	2	4	6
TOTAL WITHDRAWALS	MI	1,853	1,927	1,884
Of which: freshwater (≤1,000 mg/l total dissolved solids)	MI	1,853	1,927	1,884
Of which: other types of water (>1,000 mg/l total dissolved solids)	MI	-	-	-

The breakdown of water discharge by source is presented in the table below:

WATER DISCHARGE BY SOURCE	UM	FY 2024	FY 2025	FY 2026
Surface water	MI	1,739	1,509	1,752
Groundwater	MI	-	-	-
Seawater	MI	-	-	-
Third-party water resources	MI	-	-	-
TOTAL DISCHARGE	MI	1,739	1,509	1,752
Of which: freshwater (≤1,000 mg/l total dissolved solids)	MI	1,739	1,509	1,752
Of which: other types of water (>1,000 mg/l total dissolved solids)	MI	-	-	-

In the following table are presented the values for water consumption by:

WATER CONSUMPTION	UM	FY 2024	FY 2025	FY 2026
TOTAL WATER CONSUMPTION IN ALL AREAS	MI	114	418	133
TOTAL WATER CONSUMPTION IN WATER-SCARCE AREAS	MI	114	418	133

For all parameters relating to authorised discharges (including the presence of hazardous substances pursuant to Table 5, Annex 5 to Part III of Italian Legislative Decree 152/06, as subsequently amended), checks are performed by qualified external laboratories in compliance with the requirements of the Integrated Environmental Authorisation. Additional information regarding wastewater quality parameters is presented in “Pollution” section.

Water Footprint

Since 2011, we have applied the LCA (Life Cycle Assessment) methodology, in line with the ISO 14046 standard, to assess our water footprint and the potential environmental impacts of the life cycle of production from cradle to grave. It thus includes all production activities and processes (water consumption, electricity and thermal energy, waste production, etc.), both upstream (raw materials, transport) and downstream (distribution, use, end of life).

The specific method used for the water footprint is the Available WATER REmaining (AWARE) method (Boulay et al., 2016), which represents the remaining water available per area after human and ecosystem demand has been met. It therefore involves the assessment of the potential for water deprivation for both humans and ecosystems, assuming that the less water is available, the greater the likelihood that another user will be deprived.

The greatest contributions to the water footprint are raw materials, the plant's direct water consumption and auxiliary materials. The table below shows the results of the evaluation of the AWARE water footprint, calculated in the Fiscal Year 2025 and 2026.

It is noted that the Fiscal Year 2025 results have been recalculated using the new model adopted in 2026, in order to maintain consistent assumptions when comparing the two years. Compared to the previous year's model, the basic assumptions, the modeling of certain raw materials, auxiliaries, and outsourced processing have been updated.

ALCANTARA

WATER FOOTPRINT - AWARE 1.07 Method	(m³ e)		(m³ e/Kg)		(m³ e/m²)	
	FY 2025	FY 2026	FY 2025	FY 2026	FY 2025	FY 2026
Alcantara average total	39,660,773	30,097,595	23.4	18.3	8.2	6.5
Alcantara average (dyeing process only) ²⁷	23,969,516	18,097,803	14.1	11.0	5.0	3.9
Alcantara average (excluding dyeing process) ²⁸	15,691,258	11,999,792	9.2	7.3	3.2	2.6

27.
To assess the AWARE water footprint of the Alcantara dyeing process, the following elements were included: water consumption, equal to 75% of the total freshwater consumption; 100% of the raw materials associated with dyeing; 75%-100% of the chemicals used for water treatment; 50% of the electricity consumption used for water treatment; and the electricity and thermal energy consumption related to the dyeing department.

28.
The value was calculated by subtracting from the total WSF the amount related only to the dyeing process.

2.4 CIRCULAR ECONOMY

Policies, commitments and actions for a more circular Alcantara

The Company’s commitments towards a more circular production model take two main directions: the use of alternative polymers (recycled, partially bio-based) and the active research of technologies to improve the management of the end of life of the material itself.

Over the years Alcantara has launched a comprehensive plan of actions aimed at improving the circularity of the material itself. One of the main areas of focus involves increasing the use of recycled materials, particularly post-consumer recycled PET (rPET).

Innovation

For Alcantara, Italian-made products have always stood for quality, value, safety, cutting-edge technology, and a focus on style and design. Regarding **recycling**, at the end of their useful life, Alcantara products can technically be downcycled²⁹ into nonwoven fabrics, insulation panels, or reconstituted foams. To support the transition toward circularity, the Company has launched an R&D plan aimed at identifying a technology capable of recycling Alcantara material at end-of-life through depolymerisation and chemical recycling, despite the heterogeneous composition of the products.

Thanks to its collaboration with GR3N, an innovative startup committed to eliminating plastic waste on a global scale, Alcantara has received laboratory-level confirmation that it is possible to fully recover the polyester component

of end-of-life material. GR3N’s patented technology, called MADE (Microwave Assisted Depolymerisation) enables the recycling of PET plastic waste and polyester fibre into virgin-quality PET. This technology was successfully applied to recover Alcantara material used in the Seed Bed exhibition (part of the Alcantara-MAXXI project), confirming its effectiveness at pilot scale and the quality of the recovered monomers.

Alcantara has also started in the Fiscal Year additional collaboration with Research Institutes and companies specialised in fibre sea component waste recovery with the aim to speed up the acid terephthalic recovery for chemical recycled PET production. In particular:

- 1. Cooperation with a Spanish Technological Institute is ongoing and activities are related to: phthalic pastes characterisation (done), terephthalic acid recovery and purification (done), PET production (ongoing, by ester formation and follow polycondensation step), creation of network with the aim to promote the phthalic waste recycle recovery for PET production (increasing of Alcantara circular economy)

- 2. Cooperation with advanced new companies that promote innovation circular economy technologies for fibre sea component waste recovery (phthalic acid recovery or chemical recycled PET recovery). No additional information could be now disclosed because these activities are protected with Non-Disclosure Agreements

As part of its sustainability commitment, the Company has, in recent years, intensified its research and development activities to identify **raw materials** that serve as alternatives to fossil-based polymers, with the goal of reducing carbon dioxide emissions. This effort has led to the creation of new products containing increasing percentages of:

- **Partially bio-based polymers**, composed at least in part of material derived from biomass. For instance, the polyester used by Alcantara includes ethylene glycol sourced from sugar industry waste;
- **Recycled polymers (rPET)**, obtained through the mechanical recycling of post-consumer waste without the use of

chemical treatments. This process uses a **post-consumer polymer** of European origin, certified under the **Global Recycled Standard (GRS)** by Textile Exchange.

With regard to laminated products, the Company has promoted the use of **textile backings containing recycled raw materials**, favoring, whenever possible, **post-consumer content** and **GRS-certified suppliers**.

The new generation of recycled-based materials has been presented to numerous clients, generating strong interest and initiating several development projects—particularly in the **automotive** and **high-end accessories** sectors—with initial launches by renowned OEMs.

29. Downcycling is the process of producing recycled materials that have a lower economic value or quality compared to the original product.

The Company plans to progressively maximise the use of recycled polyester.

Analysis and certification activities aimed at ensuring the effective content of these materials to customers have been undertaken. Analytical assessments of the percentage of bio-based polymers content were introduced, measuring the percentage of ‘modern carbon’ as per ASTM D6866 (American Society for Testing and Materials) standards. Such evaluations are performed monthly on every batch of incoming polymer and for every kind of material produced. The percentage is reported in the product’s technical specifications. No standard laboratory methods are currently available to accurately define the presence and quantity of recycled polyester in the end product. In 2025, the Company renewed its **Recycled Claim Standard (RCS)** certification from Textile Exchange, which certifies the use of recycled material and ensures **traceability throughout the entire supply chain**.

Research and development

Alcantara invests an average of 3% to 5% of its annual revenue in Research and Development activities. The Company operates a unique Research and Development Centre in Europe, fully dedicated to product and process improvement. It is equipped with pilot plants, advanced analytical facilities, and specialised laboratories. This scientific hub is the core of Alcantara’s innovation, backed by proprietary know-how covering the entire spectrum of polymer processing, textile and chemical processes, application technologies, and finishing techniques. The R&D team is made up of approximately 50 professionals, including PhDs, technical graduates, and highly skilled operators. Activities are structured around an “on-demand” approach, aimed at meeting customers’ specific needs, and an “on-proposal” model, designed to anticipate market trends by offering original, high value-added solutions.

Goals and targets

As part of its environmental strategy, the Company has defined a series of targets related to the use of materials and the transition toward a more circular model of production. These objectives are part of a continuous improvement path aimed at reducing dependence on fossil-based raw materials, enhancing the value of recycled resources, and optimizing input and output flows across the entire production cycle.

Main targets

- 1. **Gradually increase the use of recycled PET** in spinning processes, with an internal goal to exceed **50% rPET usage by Fiscal Year 2031**.
- 2. **Diversify sourcing**, validating multiple suppliers of rPET chips and flakes by selecting flake sources with consistent quality and low impurity levels.
- 3. **Improve material circularity** by valorizing by-products and promoting the recovery of resources in downstream processes.

During the period April 2021 – March 2022, the polymers used in spinning were composed of 10.5% partially bio-based PET and 1.5% mechanically recycled PET. By 2026, these percentages evolved to 10.1% bio-based PET and 18.5% recycled PET, showing a significant increase in the use of recycled materials, according to the Company targets.

The definition of these targets is grounded in a responsible production approach, which integrates product quality, consumer safety, and environmental protection. Among the innovations introduced is a new patent pending dyeing technology applied on an industrial scale, which reduces the use of energy and dyes, improves product performance, and limits the impact on wastewater discharges.

Compliance with regulations on restricted substances is regularly verified by independent external laboratories. These checks are complemented by ongoing internal monitoring and the requirement for all suppliers to annually update technical documentation and renew their REACH Regulation compliance declarations.

The Company’s objectives are closely linked to the management of material flows, in line with the principles of the circular economy:

- **Promotion of circular design**, which considers product durability, recyclability, and disassembly.
- **Increased circular use of materials**, through growing use of recycled PET.
- **Reduction in the use of virgin raw materials**, prioritising sustainable sourcing and material recovery.
- **Valorisation of production by-products**, such as:
 - o **ALCANOL®**, a recovered vinyl polymer used as an adhesive in the paper industry;
 - o **ALCARENE®**, a thermoplastic polymer used in spinning and later destined for the plastics and footwear sectors

Both polymers, along with the solvents used in production, are **recovered, purified, and reintegrated** into the manufacturing cycle, thereby reducing waste and **generating value from secondary materials**.

Key Performance Indicators

Materials used by weight

During Fiscal Year 2026, total raw material consumption decreased compared to previous years. In particular, there was a decline in the use of raw materials for polyurethane, thermoplastic polymers, abrasive papers, adhesives and binders. The use of recycled PET also continued, with still significant absolute values, reaffirming the commitment to a circular economy.

MATERIALS USED BY WEIGHT	UNIT	NON RENEWABLE RESOURCES ³⁰	FY 2024	FY 2025	FY 2026
Raw materials for polyurethane	Kg	X	2,082,427	1,670,250	1,368,688
Plastic packaging	Kg		268,416	38,839	39,656
Thermoplastic polymers	Kg	X	5,148,373	3,834,924	1,906,127

30.
X stands for resources that cannot be regenerated within a short timeframe, such as minerals, metals, oil, gas, carbon, etc.

Regarding spinning phase, in Fiscal Year 2026, Alcantara used 10.1% **partially bio-based PET polymers** and **18.5% mechanically recycled PET** in its polyester spinning phase, relative to total polyester applied in such phase. The

Company’s stated goal is to **progressively increase** these percentages while simultaneously **reducing the use of fossil-based polymers**.

Polymers used in spinning

PERCENTAGE OF POLYMERS USED IN SPINNING – FY 2026	
Partially bio-based	10.1%
Recycled PET	18.5%

Water-based process

The production based on the new water-based process, previously mentioned, has continued to generate tangible environmental benefits, with a reduction in CO₂ emissions and primary energy savings compared to the average values from the 2012–2014 period.

For the most recent period (April 2025 – March 2026), internal monitoring confirmed the continued environmental benefits, with an energy saving of 1.83 TOE/km ALC® FANS and a reduction in emissions of 3.35 tons CO₂e/km ALC® FANS, following the same calculation method previously validated by the GSE.

These results demonstrate the consistency and effectiveness of the innovative process, even beyond the official incentive period.

		MONITORING PERIOD APRIL 2023 - MARCH 2024	MONITORING PERIOD APRIL 2024 – MARCH 2025	MONITORING PERIOD APRIL 2025 – MARCH 2026
Specific Energy Savings	TOE/ km ALC® FANS	1.17	1.44	1.83
Emissions avoided	ton CO ₂ e / km ALC® FANS	2.58	3.06	3.35
Note:		Recognised by the GSE (National Energy Services Manager) through the issuing of Energy Efficiency Certificates	Internal estimation based on the same monitoring and calculation scheme used for GSE	Internal estimation based on the same monitoring and calculation scheme used for GSE

Production of by-products

At the end of the production process, polystyrene and polyvinyl alcohol waste are generated. Since these materials cannot be reused by the Company due to quality requirements in the production process, they are sold as by-products for industrial use under the following names:

- ALCANOL®: a vinyl polymer used during production as a fixative, which is later dissolved in water, recovered, and purified. It is widely used as an adhesive, primarily in the paper industry.
- ALCARENE®: a thermoplastic polymer used as an auxiliary component during the spinning phase to protect extremely fine fibres. It is later dissolved with a selective solvent. Both the solvent and the polymer are recovered and purified as part of the production process. The polymer is then marketed for injection molding applications in the plastics and footwear industries.

Both the solvent and the polymer are recovered and purified as part of the production process. The polymer is then marketed for injection molding applications in the plastics and footwear industries.

PRODUCTS AND BY-PRODUCTS SOLD ON THE MARKET ³¹	UNITS	FY 2024	FY 2025	FY 2026
Alcanol®				
Quantity produced and sold on the market	Kg	447,416	521,544	382,640
Product percentage compared to the raw material	%	50.39%	70.56%	79.83%
Alcarene®				
Quantity produced and sold on the market	Kg	1,119,942	636,659	476,677
Product percentage compared to the raw material	%	83.11%	74.25%	65.27%
Alk-Fill FI e Alk-Fill FE (textile waste)				
Quantity produced and sold on the market	Kg	155,937	154,890	143,088
Alk-Fill Buff (buffing powder)				
Quantity produced and sold on the market	Kg	3,300	-	3,400

31. The percentages shown in the table are calculated in relation to the raw materials actually used in production.

Waste

The waste produced is subject to off-site recovery or disposal operations. In Fiscal Year 2026, the Company generated 10,031.304 tonnes of waste, 81.8% of which was classified as non-hazardous. The main types of non-hazardous waste include:

- Sludge from on-site wastewater treatment (representing 53% of non-hazardous waste), and
- waste chemicals (9%).

Hazardous waste accounts for 18.2% of the total, of which:

- 34% consists of organic waste containing hazardous substances, and
- 28% consists of packaging containing residues of hazardous substances.

All waste is sent to facilities located within Italian territory.

Compared to the previous Fiscal Year, variations in the amounts assigned to categories D1, D9, and D15 were mainly due to technical and economic factors.

The following tables provide a breakdown, by type and volume, of waste produced and disposed.

WASTE MANAGMENT	UNIT	FY 2024				FY 2025				FY 2026			
		Hazardous	Non hazardous	Total	%	Hazardous	Non hazardous	Total	%	Hazardous	Non hazardous	Total	%

Impacts, risks
and opportunities

As part of the double materiality assessment, the various impacts that the Company’s activities may have on its employees were thoroughly examined. Some of these impacts - both positive and negative - are already occurring, while others may materialise in the future. Health and safety in the workplace are among the topics of greatest concern for all stakeholders. While the risk of accidents cannot be eliminated, it is kept to a very low level through careful and effective management. From a corporate perspective, the implementation of appropriate safeguards and management systems also represents an opportunity to reduce the Company’s exposure to reputational damage and regulatory sanctions. Moreover, the analysis highlighted that impacts related to employment stability and economic security - ensured without discrimination - are of critical importance. While it is acknowledged that the risk of negative impacts cannot be entirely ruled out, the Company is committed to promote stable and protected working conditions, even during periods of economic or organisational difficulty.

Impacts related to end users are primarily linked to the quality and safety of the product. Alcantara also believes it is essential to maintain transparent, direct, and comprehensive communication regarding sustainability performance and product-related information (e.g., material care instructions). Failure to do so could lead to negative impacts on customers and end users. In terms of risks and opportunities, poor communication management could result in considerable reputational damage to the brand.

3.1 ALCANTARA'S EMPLOYEES

Policies

People represent the key factor in Alcantara's success, and this principle forms the foundation of the Company's human resources management policies. Alcantara places great importance on maintaining a healthy, safe, and inclusive work environment, providing individuals with the tools they need to protect their rights and support their full professional and personal development.

In this context, Alcantara has integrated into its corporate policies specific measures aimed at protecting and improving working

conditions, with particular focus on:

- respect for fundamental human rights,
- health and safety in the workplace,
- the physical and mental well-being of its employees.

These areas are an integral part of the Company's sustainability strategy and its responsible human resource management model.

As a confirmation of its commitment, Alcantara formally adheres to the main international standards on social rights, including the Universal Declaration of Human Rights, the Conventions of the International Labour Organization (ILO), and the United Nations Conventions on the Rights of the Child. These principles are incorporated into the Company's Code of Ethics, which is publicly available and accessible to all employees, collaborators, and external stakeholders, in a spirit of transparency and accountability. Furthermore, Alcantara periodically

renews its **SA8000** certification, which requires companies to uphold fundamental human rights for workers. This includes the prohibition of child and forced labour, assurance of health and safety in the workplace, recognition of the right to freedom of association and collective bargaining, and a ban on discrimination and degrading disciplinary practices. The standard also sets limits on working hours in line with local and international regulations and requires the payment of a living wage. Additionally, companies must adopt a management system to continuously monitor and improve social compliance.

With regard to health and safety in the workplace, it is worth noting that since 2021, Alcantara has been certified under the ISO 45001 standard, applicable to both its Milan Headquarters and the Nera Montoro Production Site. This certification attests to the adoption of an Occupational Health and Safety Management System in accordance with the ISO 45001 international standard. The system is designed as a dynamic tool, focused on continuous improvement,

and is based on the active and cross-functional engagement of all personnel at every level of the Organisation. The Company's commitment to safeguarding the health and safety of all employees and collaborators is fully expressed in its Health, Safety and Environment Policy (HSE Policy), which is publicly available online.

Support for the United Nations Global Compact

In Fiscal Year 2026, the Company renewed its support for the United Nations Global Compact (UNGC) for the ninth consecutive year—the world’s largest corporate sustainability initiative. By reaffirming its adherence to the UNGC, the Company reinforces its long-term commitment to a responsible growth model based on the respect for and promotion of the Ten Principles related to human rights, labour, the environment, and anti-corruption. Through the implementation of strategic initiatives, the Company actively contributes to the advancement of the United Nations Sustainable Development Goals (SDGs). In line with this commitment, the Company provides annual reporting on its activities and progress related to the Ten Principles through this document, which also serves as its Communication on Progress (CoP).

Employee engagement

The definition and implementation of corporate strategies at Alcantara are grounded in the unwavering commitment to upholding all employee rights. Throughout its processes, the Company actively listens to and takes into account the opinions and interests of its workforce through a variety of formal and informal dialogue and engagement tools. These include continuous dialogue with trade union representatives (RSU and RLSA), direct interactions between managers and team members, discussions with the Human Resources Department, involvement of the workers’ representative for **SA8000**, as well as active reporting channels through the Supervisory Body and the Whistleblowing system. These mechanisms are complemented by periodic initiatives and surveys—also in collaboration with the Parent Company—aimed at continuously monitoring and enhancing employee well-being. Dialogue with trade unions and employees is a constant and ongoing process, based on openness and transparency.

This approach enables the Company to promptly address employee concerns and needs, particularly through:

- The **Social Performance Team**, established under the SA8000 standard, which meets every six months to monitor and improve social and labour-related conditions within the Organisation;
- The **annual meeting of the Corporate Observatory**, as required by the National Collective Labour Agreement (CCNL), serves as an additional forum for reviewing and assessing corporate policies related to employee well-being and rights.

The operational responsibility for ensuring effective employee engagement—and for integrating the resulting insights into decision-making processes—rests with the Company’s top management. Specifically, the CEO and functional Directors are tasked with ensuring alignment between defined policies, the needs expressed by employees, and the strategic objectives of the Organisation.

Dialogue with employees in Fiscal Year 2026

Throughout Fiscal Year 2026, the Organisation maintained a structured and continuous dialogue with workers’ representatives (RSUs), in line with the principles of collective bargaining and active employee participation, as established by national regulations. These meetings aimed to ensure transparency in corporate decision-making and to promote the early involvement of social partners in key organisational processes.

TOPICS OF DISCUSSION	ENGAGEMENT ACTIVITIES
Working hours and downtime	A periodic schedule of production plant and head office closures was shared with the RSUs, defined based on market trends and production needs, including international market demands. Decisions were communicated in advance and, when necessary, jointly discussed.
Production plant reorganisation	In response to demand fluctuations, factory layouts were periodically revised to ensure safety, quality, efficiency, and work-life balance. These changes were implemented through collective agreements, emphasizing the responsible and shared use of work flexibility, both in terms of organisation and job content. The agreements also included training initiatives to support multi-skilling and professional development.
Remote working	The use of remote working was confirmed for employees at the Milan office. Implementation methods were defined in collaboration with trade union representatives, taking into account both operational requirements and employee well-being.
Corporate observatory and technical committees	In addition to formal bargaining meetings, non-binding discussions were held through the Corporate Observatory and thematic committees. These forums facilitated information-sharing on specific or general topics, with the aim of preventing conflicts, promoting constructive dialogue, and managing organisational change collaboratively.
Performance bonus scheme	The five-year performance bonus framework agreement was confirmed with the RSUs. The annual bonus amount is linked to the achievement of corporate objectives, with progressive incentive mechanisms. For Fiscal Year 2026, 47% of the target was achieved, notwithstanding an unfavorable international context. The 2026 bonus included: • an attendance-based supplement; • €200 in additional welfare services; • €50 paid into the industry pension fund (Fonchim) for each enrolled employee; • the option to convert individual bonuses into welfare credits via a dedicated platform. Over the past 10 years, the Participation Bonus has generated a total economic value of approximately €13,000 per employee, in addition to €500 in supplementary contributions to the Fonchim pension fund for participating employees.
Joint training initiatives	Training programmes were subject to union consultation and focused on developing soft skills for Company managers, technical training for R&D staff (project management), and regulatory and technical updates in the automotive and lean manufacturing sectors (3S/5S). Thanks to second-level bargaining, training plans worth approximately €370,000 have been financed through the interprofessional fund Fondimpresa over the past 10 years.

Protection of rights and management of grievances

With reference to any critical concerns regarding potential or actual negative impacts on stakeholders or the conduct of business operations and relationships, Alcantara adopts a responsible and transparent approach. Such critical issues, if deemed significant, are promptly brought to the attention of the governance bodies, respecting the convening timelines established by the Company’s Bylaws. In particular, relevant matters are submitted to the Executive Committee and the Board of Directors, each with specific responsibilities and decision-making scopes.

Since 2018, Alcantara has implemented a structured whistleblowing system. The Whistleblowing Policy was updated during the 2025 Fiscal Year, in accordance with the development of relevant legislation. The procedure has been disseminated both internally and externally and is publicly accessible via the Company website. To support this procedure, an IT platform for collecting reports has been implemented and made available. The Company’s Organisational Model, which integrates the Whistleblowing Procedure, also provides for specific periodic training courses for employees.

For guidance on the application of the Organisation’s policies and practices for

responsible business conduct and to raise concerns regarding corporate behavior, several reporting channels exist, including the Legal Department of the holding company, as well as tools designed to protect whistleblowers. According to the Company’s procedure, a whistleblowing department has been established, composed of the Supervisory Body, the Human Resources Director, and the external legal advisor. This department plays a central role, being identified as the primary autonomous and independent recipient of reports and responsible for conducting the preliminary investigation concerning the reported facts.

Within the scope of the SA8000 Certification, a communication channel has been established for SA8000 workers’ representatives at the Milan headquarters and the Nera Montoro plant. Anonymous reports can also be submitted via mailboxes located both at the headquarters and the plant. The Company maintains a well-developed system of industrial relations, where the union can engage and request clarifications at all levels, with both official and informal interlocutions with the Human Resources Management and meeting the CEO at least once a year.

Actions, initiatives, and projects

Training

Alcantara believes that staff training is a fundamental tool to promote the growth and personal development of employees, enhancing each individual’s role and contributing to the achievement of corporate goals. Each year, the Company identifies the training needs of every division, assigning a priority level to each requested course. All categories of personnel are directly involved in training actions and plans in the following cases:

- onboarding into the Company;
- transfers to other positions;
- organisational changes and technological innovations that significantly modify the professional content.

Providing effective training is one of the main objectives of the Human Resources department, which assesses the effectiveness of training packages delivered through a learning test at the end of the course (for external courses and Environmental Safety Services). Additionally, department managers evaluate the effectiveness of the training carried out for employees as part of their annual performance appraisal.

Health and Safety

The management system adopted is based on a set of well-established actions formalised within the Health, Safety, and Environment Policy, which contribute to keeping the health and safety system active and dynamic through the involvement of all personnel at every level of the Organisation. This commitment enabled the Company to obtain certification of the health and safety management system according to the ISO 45001 standard, issued in September 2021 at the end of the migration project from the OHSAS 18001 certification. During Fiscal Year 2026, Alcantara continued to strengthen and develop its system through the following initiatives:

- continuous updating of risk assessments, including those related to the environmental context such as climate change and extreme weather events.
- the “Zero Accidents Project,” aimed at minimizing incidents;
- TORAY Group’s international audits,
- establishment of functional working groups created to encourage active participation of personnel in the correct identification, assessment, and reduction of risks and impacts in health, safety, and environmental areas;

- emergency management with equipment exceeding regulatory requirements, including dedicated firefighting means, internal ambulance, Company infirmary, and a medical facility active daily and available 24/7;
- training and awareness activities also addressed to employers of contracting companies, on specific topics such as DPR 177/2011 regulations (work in confined spaces), preparation of the DUVRI, and other safety measures.

The “Zero Accidents” Project

The “Zero Accidents” Project was created with the goal of establishing a set of measures aimed at identifying possible actions to improve safety management beyond the requirements set by mandatory regulations and current standards, with the ultimate aim of achieving the “zero accidents” goal. Over the past 17 years, the project has undergone significant technical and operational improvements, mainly thanks to the implementation of a structured and diversified set of tools and measures.

Safety Policy:

Every year, the holding company uses various resources to raise

awareness about Health and Safety and to emphasise the importance of the current policy.

Hyari-Hatto (Incidents):

The holding company sends incident reports from each company to all Group companies; the main purpose is to allow evaluation of similar situations and to propose specific prevention and protection measures based on the circumstances of each company.

Safety Patrol and Safety Shift Leader:

Weekly or shift-based internal checks and inspections. Since 2014, the Safety Patrol team has also included the three operators who stood out in the previous year for the highest number of safety proposals submitted.

Safety Day:

Collective explanation of the main Company events of the quarter and sharing of guidelines and Company projects with all factory employees.

Safety Shift Meeting:

Safety meetings for shift operators.

Near Miss:

An event that had the potential to cause harm but did not actually result in injury to people.

Potential Risk Situation:

A risk situation that could cause an accident, reported by employees as part of prevention and training activities to raise risk awareness.

Safety Proposal:

The goal is to improve health, safety, and the working environment beyond the requirements set by mandatory regulations and current standards, through suggestions from employees, followed by the implementation of appropriate solutions.

ZERO ACCIDENT PROJECT RESULTS	NEAR MISS	POTENTIAL RISK	SAFETY PROPOSAL
FY 2024	23	215	352
FY 2025	17	220	347
FY 2026	23	174	363

Carpooling

As part of the Environmental and Social Sustainability project promoted by Alcantara, a system to encourage carpooling and the use of non-polluting personal transportation (bicycles and electric micro-mobility) was launched in December 2023 for the Nera Montoro plant and the Milan office.

The project involves the use of a specialised digital platform, UP2GO, which allows employees to plan their commutes by offering or requesting rides from colleagues through an app available on any smartphone.

The platform enables the monitoring of shared trips, kilometers traveled, and CO₂ saved, awarding users credits to activate a quarterly economic incentive system.

Between December 1, 2023 (the date the initiative was reactivated after the pandemic emergency) and March 31, 2026, project participants recorded a total travel distance of 116,311 km.

During the mentioned period, quarterly prizes were awarded to the top three carpooling users and the best user of non-polluting means of transport for each quarter. The Company intends to relaunch the project for the next Fiscal Year as well, providing for an update to the reward system and regulations.

Employees Benefits

All personnel benefit from additional advantages beyond those established by the collective labour agreement, with the aim of promoting and improving employee well-being within the Company environment. In Fiscal Year 2026, the Company allocated 1.86% of Alcantara’s revenues—amounting to a total of €2,460,000.00—to employee benefits, including:

- **Scholarships** for employees’ children
- **Bonuses related to the Zero Accidents Project**
- **“No Barriers Award”**: a bonus established in 2016 for employees’ children with disabilities

- **Loyalty bonus**: awarded to employees who reach 25 years of service
- **Inter-Company nursery**: the facility has been operating for the eleventh consecutive year in collaboration with two other local companies. The nursery is open to all children in the area, not just employees’ children
- **Company canteen**: the Company fully covers fixed operating costs. Employees pay only a small percentage of the meal cost
- **Supplementary professional and non-professional insurance**: a policy provided by the Company in addition to INAIL coverage, extended to non-work-related activities as well
- **Fida and Faschim funds**: by paying a small monthly fee, employees can join a fund largely financed by the Company that offers reimbursements for healthcare services
- **Extra-curricular activities**: an annual amount allocated by the Company to organise cultural and sports activities for employees and their families
- **24/7 on-site medical service**: a medical unit with an ambulance and defibrillator is available at the Nera Montoro facility
- **On-call allowance**: granted to personnel responsible for emergency and maintenance management
- **Routine and extraordinary maintenance of green areas and renovation of various offices and meeting rooms**
- **Alcantara welfare plan**: as part of Company-level bargaining, Alcantara has implemented a welfare credit plan for the next five years. These credits can be used on the corporate website for goods and services in the fields of health, sports and wellness, education, culture, and entertainment—including for the benefit of family members—while also offering tax advantages. In addition to these credits, employees may add more by converting part or all of their performance bonus into welfare credits
- **Bonus for the Carpooling Project.**

Communication Activities

Alcantara uses the following internal communication tools to encourage interaction and engagement:

- Intranet and Company bulletin boards, with continuous updates and the integration of employee communications into the new HR management software;
- “Inside” Company newsletter, published every six months and distributed in print format to all employees at the headquarters and production plant.

Remote working

During the Fiscal Year 2026, there was an increase in the number of remote working hours, enabled through a dedicated agreement with the trade unions. This tool is considered to support a better work-life balance while also enhancing employee awareness and overall Company productivity.

The agreements in place also allow for broader use of remote working for parents of young children, caregivers of people with disabilities, or in the presence of exceptional family or personal circumstances.

TOTAL REMOTE WORKING HOURS	FY 2024		FY 2025		FY 2026	
	Men	Women	Men	Women	Men	Women
Executive/ Manager	7,167.48	4,257.75	10,032.02	7,091.49	13,500.32	7,463.28

Incentive measures

Through its policies, incentive tools, and development programmes, Alcantara aims to value, retain, and attract talent, with a focus on resource development and recognition. To this end, these measures are constantly evolving, with the goal of improving organisational tools and contractual mechanisms, while enhancing individual professionalism.

Despite the reference period being particularly challenging for the global economy, the Company chose to uphold its planned development pathways, as shown in the table below.

NUMBER OF PEOPLE INVOLVED IN INCENTIVE MEASURES	FY 2024	FY 2025	FY 2026
M.B.O. (management by objective) and one-off	120	90	94
Salary increase	16	36	12
Change in job classification level	70	69	54
TOTAL	206	195	160

Goals
and targets

Among the commitments made, Alcantara has set itself an ambitious goal: to eliminate workplace accidents entirely. To achieve this, the Company has implemented a structured set of prevention and protection measures, monitoring procedures, and dedicated training programmes, with the aim of continuously improving workplace safety conditions and ensuring the well-being of its employees.

Performance
Indicators

Employees profile

As of 31 March 2026, the Company employs 605 people, of which 89 are based at the Milan office (one of whom works for the representative office in China), and 516 at the production plant and R&D centre in Nera Montoro.

The average number of employees during Fiscal Year 2026 was 606,5. This basically confirms the number of units compared to the average headcount of the previous Fiscal Year (equal to 607).

ALCANTARA

In order to ensure employment stability, 99.33% of the workforce is employed under permanent contracts. During the reporting period, all Alcantara employees were hired on full-time contracts, with no part-time arrangements. This data highlights an organisational structure focused on providing stability and continuity in employment.

ALCANTARA

Over the past 10 years, Alcantara’s workforce has grown by 25.8%, with the Company hiring 123 additional employees since 2015. During Fiscal Year 2026, Alcantara recorded 30 new hires, corresponding to a positive turnover rate of 4.95%. In the same period, there were 26 terminations, resulting in a negative turnover rate of 4.29%.

ALCANTARA

During Fiscal Year 2026, due to contingent situations related to the global macroeconomic and geopolitical context, the Company implemented a rotating use of ordinary wage guarantee fund (cassa integrazione ordinaria) for a total of 74,859.50 hours, involving 552 workers across the two Company sites. The wage guarantee period ended on 13 April 2026, with the regular resumption of production activities.

In addition to Alcantara’s 605 employees, including both permanent and fixed-term contracts, the Company employed 3 temporary agency workers at the China Representative Office during the reporting period.

Alcantara also hosted 12 interns and trainees at its Italian locations as part of various training programmes.

At the Nera Montoro plant, the following programmes were activated:

- 2 school-to-work alternation internships (Alternanza Scuola-Lavoro)
- 5 ITS training courses (Higher Technical Institutes)

At the Milan office, the following were activated:

- 5 extracurricular internships
- 0 curricular internship

At the end of the internship experience, in Milan, 4 extracurricular interns were hired under apprenticeship contracts, while one internship was still ongoing as of the close of the reporting period. The use of these forms of engagement addressed both training and operational needs, maintaining a connection with the local area and the technical-professional education system.

Diversity

Gender

In 2026, the Organisation’s workforce is composed of 605 employees, including 100 women and 505 men. The predominance of male personnel reflects a general trend in the industry in which it operates, which has traditionally employed more men than women. Nevertheless, there is a continued commitment to ensuring equal opportunities for all staff and fostering maximum inclusion within the Company.

Age

The age distribution shows a predominance in the 30–50 age group, which represents 63.6% of the total workforce (386 individuals). Employees over the age of 50 make up 31.7% (192 individuals), while those under 30 account for 4.4% (27 individuals). From an age perspective, the distribution is mainly concentrated in the 30–50 range, which accounts for 63.6% of the staff (386 individuals). Employees over 50 represent 31.7% (192 individuals), while 4.4% (27 individuals) are under 30, reflecting a mature and well-established demographic structure, yet one that leaves room for generational renewal initiatives.

Management by gender

In 2026, Alcantara’s managerial structure is organised into two main levels of responsibility: executives and middle managers. There are 15 executives, all of whom are male, while the middle management category includes 68 individuals, 19 women and 49 men. The female representation, accounting for 27.9% among middle managers, is more significant than at the executive level, indicating an initial sign of diversification in intermediate roles.

MANAGEMENT BY GENDER	FY 2024			FY 2025			FY 2026		
	Women	Men	Total	Women	Men	Total	Women	Men	Total
Executives	0	15	15	0	15	15	0	15	15
Middle managers	18	48	66	20	44	64	19	49	68
TOTAL	18	63	81	20	59	79	19	64	83

Protected categories

With the aim of promoting greater inclusion within the Company, employment opportunities are offered to individuals belonging to the protected categories defined by current legislation. In Fiscal Year 2026, employees from protected categories accounted for 7.60% of the total workforce - a figure exceeding the legal minimum requirement.

To support this approach, any violations of the Code of Ethics or potential risks in this regard can be reported to the competent supervisory body, with the option, if necessary, to involve SA8000 workers’ representatives.

PROTECTED CATEGORIES	FY 2024	FY 2025	FY 2026
No. of employees belonging to protected categories	46	47	46
% of protected categories out of total employees	7.07%	7.82%	7.60%
No. of Board members belonging to protected categories	0	0	0
% of protected categories out of total Board members	0	0	0

Parenting and Leave

During Fiscal Year 2026, a total of 194 employees (160 men and 34 women) took maternity or paternity leave (both mandatory and optional), or parental leave to care for family members with disabilities (in accordance with Italian Law No. 104). At the end of the leave period, all employees - except those still on maternity leave - returned to work. This figure increased compared to the previous year (172 employees).

Fair wages and remuneration

The uniform, non-discriminatory application of the National Collective Labour Agreement (CCNL) for the chemical industry represents the minimum standard for protecting the economic and regulatory conditions of the workforce. All employees receive salaries above the minimum levels set by the national contract. Through negotiations with trade union representatives, the Company has established more favourable conditions than those required by the CCNL. These include additional financial incentives, welfare measures, and initiatives supporting work-life balance. The Organisation also adopts mechanisms to safeguard employees’ economic stability, such as access to social safety nets, which are managed in accordance with legal requirements and contractual provisions. All actions are carried out in line with national regulations and the applicable collective agreement.

In Fiscal Year 2026, the ratio between the average Gross Annual Salary (RAL) of female employees and that of male employees is as follows:

- **0.75** for executives and middle managers,
- **0.99** for office staff and apprentices,
- **1.01** for blue-collar workers and apprentices.

The salary for new hires matches the minimum stipulated by the national contract, with no gender-based distinction. The ratio between the highest-paid employee’s annual salary and the median salary is 7.50. The ratio between the percentage increase in the highest remuneration³³ and the percentage increase in the median remuneration excluding the highest remuneration is 2.13.

The variable remuneration system, is linked to the achievement of different types of goals and performance targets defined both at the individual and team levels.

For the entire Company workforce, except for executives, the so-called “Participation Bonus” is established through a specific union agreement pursuant to Article 48 of the current collective labour agreement (CCNL) in use within the Company. This bonus is tied to general Company objectives, which are identified not only based on profitability and productivity criteria but also on efficiency and sustainability.

Furthermore, for executives and middle management, an additional variable remuneration system is established. This system allows performance evaluation of:

- senior management, meaning all executives and key managers included in an annual variable incentive plan linked to objectives that take into account the economic, social, and environmental performance of the Organisation.
- managerial staff, evaluated based on the responsibilities managed within the manager-employee relationship.

In Fiscal Year 2026, 23.68% of the senior management’s variable remuneration was linked to achieving sustainability-related goals, in terms of reducing environmental impact, energy efficiency, and health and safety at work (SSA).

Additionally, one-time bonuses are awarded to those who achieve results exceeding the set objectives. Finally, the Company has introduced changes in professional classifications following growth and development pathways.

³³
The remunerations considered in the calculation are not the total remunerations, but the gross annual salaries (RAL).

Employee training and evaluation

During Fiscal Year 2026, a total of 15,511 hours of training were delivered. Of these:

- **38.54%** were dedicated to onboarding courses for new hires,
- **28.02%** to the development of professional technical skills, and
- **32.54%** to health, safety, and environmental training.

Executives	14.00	0	144.50	0	158.50

Additionally, during Fiscal Year 2026, a total of 392 hours of HSE training were delivered to 88 individuals belonging to the intern and external personnel categories (e.g., employees of other companies).

Performance Evaluation

In Fiscal Year 2026, 99% of employees underwent at least one performance evaluation conducted by their supervisor. All personnel employed - except those on extended leave or newly hired - are systematically evaluated at every role change and, in any case, at least once per year.

Health and Safety

As reported in the previous sections, Alcantara has implemented a Health and Safety Management System certified according to the ISO 45001 standard, applied to both Company’s operational sites. The management system covers 100% of employees and extends to all non-employee workers (e.g. interns, contractors, self-employed workers, freelancers working exclusively for the Organisation, etc.), ensuring the protection and safety of all personnel involved in Company activities.

TOTAL NUMBER OF EMPLOYEES COVERED BY HEALTH AND SAFETY MANAGEMENT SYSTEM	FY 2024	FY 2025	FY 2026

3.2 ALCANTARA'S CLIENTS AND END USERS

ALCANTARA

Alcantara recognises the importance of clients and end users as significant groups of stakeholders, even though direct contact with the latter is limited, as the Company mainly interfaces with manufacturers of finished or semi-finished goods.

Alcantara's internal Organisation is structured by industrial sectors, allowing it to offer each client highly specialised and contextualised support. This targeted assistance, especially during decision-making phases, encourages informed choices that also take into account impacts on the end user. The management of the relationship with clients is entrusted to multidisciplinary teams, capable of effectively responding to different needs and contributing, through dialogue and active listening, to the ongoing evolution of the business strategy in line with the variety of consumer needs.

Alcantara continuously assesses the impact of its activities on consumer health, safety, and rights — including the right to transparent information. To this end, the Company carries out robust compliance activities to guarantee the safety of its products and processes. It is also committed to providing clients with clear, accessible, and transparent information to facilitate the transmission of accurate knowledge. The subjects directly affected by these impacts are Alcantara's clients, but the scope of evaluation and responsibility also extends to their clients, i.e., the end user. These subjects are heterogeneous and vary depending on the Company's multiple business sectors, including Automotive, Fashion, Interiors, and Consumer Electronics, as well as the different geographic areas in which Alcantara operates.

The material produced is not inherently harmful to health, and the potential impacts on end users largely depend on the context of use within the finished product. In some cases, end users may include vulnerable individuals, but in these contexts, Alcantara takes responsibility for ensuring the accuracy and transparency of information. Furthermore, through its website, the Company provides user manuals, cleaning instructions, and certifications to facilitate the correct and safe use of the material, thereby helping to prevent potential misuse or harmful use.

Policies

Alcantara, operating primarily in a B2B context, adopts policies aimed at managing impacts, risks, and opportunities related to the end user end users through the protection of privacy, informational transparency, and regulatory compliance of materials and production processes.

Specifically, the Company guarantees the protection of personal data in accordance with Regulation (EU) 2016/679 (GDPR) and ensures direct access to detailed product information, such as maintenance manuals and material certifications. Compliance with regulations regarding the safety of materials and processes is ensured by following standards such as REACH, CLP, fire behavior regulations, and voluntary certifications such as OEKO-TEX® STANDARD 100 and the ZDHC protocol for the Fashion sector.

These policies are implemented across all Company functions and applied to all clients and end-users without geographical or sectoral discrimination. The Chief Executive Officer is responsible for their implementation and monitoring, which takes place through the analysis of performance indicators such as complaints, service levels, evaluation reports, and technical meetings with clients.

Alcantara's sectors of application⁴¹:

AUTOMOTIVE

FASHION AND ACCESSORIES

CONSUMER ELECTRONICS

INTERIOR, CONTRACT, MARINE AND AVIATION

⁴¹.
See section
'Activities & value chain'.

Process to engage with clients and end users

Alcantara engages end users primarily through its direct clients, namely manufacturers of semi-finished and finished products. The Company is committed to providing all necessary information about safety and to ensure the best use of the product, including manuals for cleaning, washing, stain removal and safety information. The relationship with clients is managed transparently by the Commercial Departments.

Alcantara ensures a direct contact with clients using various tools, including:

- a dedicated email inbox, managed internally by the Organisation;
- direct assistance through in-person meetings;
- general contact options available on the website, also accessible to the end user;
- customer satisfaction survey sent yearly to clients and direct e-mail address for Customer satisfaction feedback.

These channels allow for receiving reports, collaborating to resolve negative impacts, and evaluating the effectiveness of the remedies provided. Alcantara has in place a structured B2B processes dedicated to handling complaints from its clients. These represent the main channel through which support and resolution of product-related issues are managed.

End users can obtain assistance by Alcantara directly via the contacts published on the website, organised by area of interest, thus ensuring a direct and easily accessible channel. The email inbox represents a direct channel managed by internal staff, allowing precise control over every received report. Contact channels are widely accessible and can be easily found on Alcantara’s website, ensuring that end users and end users are aware of how to express concerns or request assistance.

Main engagement activities

Clients’ engagement is carried out on a regular basis and across multiple phases of interaction, through mechanisms such as:

- Meetings with senior management of key clients to present Alcantara’s commitment to sustainability and related initiatives;
- Technical meetings to identify specific product or application requirements in order to develop tailored solutions;
- Design meetings, starting with the presentation of ideas and materials and continuing with the development of customised solutions based on customer needs;
- Active participation in industry events, trade fairs, and Company visits, including open-door initiatives such as school group tours;
- Proactive interaction of the Research & Development team with clients to customise the offering;
- Production and distribution of informational materials on sustainability.

During the Fiscal Year 2026, 85 meetings were organised with the Design and Colour & Trim offices of clients in the automotive sector, with 62% of activities carried out outside Europe.

Alcantara indirectly evaluates the effectiveness of its engagement efforts based on customer feedback gathered through a scorecard system, which clients use to assess the Company’s performance against criteria they deem important. Additionally, the Company constantly monitors customer satisfaction by analysing qualitative performance indicators such as complaints, service levels, and evaluation reports, and conducts an in-depth analysis of failure cases involving area managers, project managers, and product development and quality personnel.

Unless explicitly requested by the customer or end user, the Company does not offer specific product adaptations for particularly vulnerable user groups. Additionally, no product suitability warnings are currently issued for specific user categories.

Actions,
initiatives,
projects and
targets

Operating under a B2B model, Alcantara nonetheless puts end-user safety and satisfaction at the centre of its operations. To this end, the Company adopts rigorous controls, carefully selects qualified suppliers, and ensures regulatory compliance through certified processes. This commitment is reflected in continuous quality monitoring and in the transparency of the information provided to clients, so that it can be accurately conveyed to end users.

Product safety is ensured through tests commissioned by Alcantara to independent laboratories, which verify the compliance of materials with regulations and standards governing restricted substances. These assessments take place at least once a year and, for specific substances, following new regulations or updates.

For the materials used in the process, specific information regarding applicable safety documents (SDS and/or Information Sheets), REACH compliance declarations (EU Regulation for the Registration, Evaluation, Authorisation, and Restriction of Chemicals), compliance with customer and industry specifications — including voluntary protocols adhered to by Alcantara — are

requested from suppliers of chemicals and articles during the initial validation phase and, if necessary, to investigate specific risks.

During the reporting period, Decabromodiphenylethane (DBDPE, CAS No. 84852-53-9), already under observation in some regulatory areas, entered the SVHC-Candidate List (list of chemical substances candidate for inclusion in the REACH Authorisation regime - Annex XIV). This substance is used by Alcantara as flame retardant active ingredient for the production of the fire-resistant product range and specific information was given to the customers involved. At the same time, the process of replacing it with a Halogen Free formulation had reached a significant percentage of the flame retardant production volume.

The commitment to eliminating potentially hazardous substances from its production processes - launched in 2017 in collaboration with leading fashion brands and implemented through a structured Chemical Management System (CMS) - was reaffirmed in 2026.

The guidelines defined by the ZDHC programme — Zero Discharge of Hazardous Chemicals — and the CHEM 4sustainability® protocol are

adopted. These foresee the progressive elimination of substances listed in the ZDHC-MRSL (Manufacturing Restricted Substances List), currently at Version 3.1, involving the entire supply chain. To this end, a compliance clause with the ZDHC MRSL and Alcantara PRSL (Product Restricted Substances List) has been included in purchase contracts.

The Oeko-Tex label, which applies to specific product categories, indicates to end users that products categorised as “Decorative Material” (Class IV) or “Material in Direct Contact with Skin” (Class II), comply with the applicable requirements of STANDARD 100 by OEKO-TEX® regarding harmful substances. This also ensures compliance with EU textile legislation (Annex XVII of REACH), U.S. legislation on lead content in children’s clothing (CPSIA), and the Chinese standard GB 18401:2010.

During the initial development of a new product, alongside its technical and performance requirements, the mandatory and specific customer requirements on product safety are implemented and circulated across the various levels of the Company through system documentation.

During the Fiscal Year 2026, no critical events or market reports concerning product safety issues were recorded.

Impacts, risks
and opportunities

The lack of robust governance with a strong focus on sustainability issues can lead to negative impacts on both people and the environment within the Company’s operations. In addition, the absence of effective safeguards may contribute to the spread of unethical and unsustainable practices throughout the value chain. Conversely, a strong commitment to promote responsible practices and solid ethical principles across the supply chain helps raise market awareness of ESG-related issues.

4.1 ETHICS AND BUSINESS CULTURE

The Company, aware of the negative effects of corrupt practices on economic and social development in the areas in which it operates, is committed to preventing and fighting unlawful conduct in the course of its business activities. For Alcantara and the Toray Group, preventing corrupt practices is not merely a legal obligation; it is one of the core principles that guides the Group's conduct. This commitment is especially significant given the strategic importance of the sector in which the Company operates, its impact on the legal and social contexts in which it is present, and the substantial financial penalties that may be imposed for non-compliance with national and international regulations on the matter.

Policies

As a concrete implementation of its commitment, the Company has adopted a Code of Ethics, which defines the values it is inspired by in pursuing its objectives and the key principles guiding its activities, in close integration with:

- the **Organisation, management and control model** pursuant to Legislative Decree 231/2001,
- the **Whistleblowing Policy** (Legislative Decree 24/2023),
- and the **Toray Group Guidelines**.

The **Code of Ethics** and **Organisational Model** are made available to the public through the Company's website: <https://www.alcantara.com/corporate/>

As an additional tool against unlawful conduct, the Company has defined an **Anti-Corruption Policy**, updated in July 2024, which aims to consolidate and integrate existing anti-corruption rules into a comprehensive framework. The Policy explicitly refers to the United Nations Convention against Corruption and Law No. 116/2009 and seeks to enhance awareness among its recipients regarding the appropriate conduct to be adopted.

Alcantara promotes a corporate culture based on ethics, integrity, and compliance with not only mandatory regulations, but also voluntary ones, such as those related to management systems (e.g., SA8000). This approach is reflected in an integrated and constantly evolving compliance system, which includes a structured process of ongoing training.

The corporate culture takes shape starting from the **onboarding** phase, during which the Company's values are presented and all components of the compliance system are illustrated: the Organisational Model, Code of Ethics, Whistleblowing and Anti-Corruption Policies, Company

certifications, and more. Every significant update to procedures involves dedicated **training and information** activities for all personnel. Given the nature of Alcantara's activities, the following areas are considered most vulnerable to corruption risk:

- relations with Public Administration;
- gifts, hospitality, and representation expenses;
- relations with political and trade union organisations;
- relations with Public Officials and relevant Private Entities;
- assignment of consultancy, specialist, or professional services;
- contracting of works and supply of goods and services;
- extraordinary operations (acquisitions, mergers, disposals);
- personnel selection and recruitment;
- non-profit initiatives and sponsorships;
- accounting records.

Additional Corporate Social Responsibility tools

Alcantara addresses any critical issues - whether potentially harmful to stakeholders or the Company’s operations - in a timely and structured manner, bringing them to the attention of the appropriate governance bodies (Executive Committee and Board of Directors), in accordance with the timelines set out in the Company’s bylaws.

Since 2018, a **whistleblowing system** has been in place for reporting unlawful behaviour, accessible to both internal and external parties. In line with regulatory updates, the **Whistleblowing Policy** was further revised during the 2025 Fiscal Year and is publicly available on the Company’s website. Reports can be submitted either in written or oral form through the dedicated platform: <https://alcantara.segnalazioni.net/>

The procedure is integrated into the **Organisational Model** and is part of the regular training provided to employees. To ensure effective management of reports, a **Whistleblowing Team** has been established, composed of the Board of Statutory Auditors, the HR Director, and an external legal advisor. This independent body is the primary recipient of the reports and is responsible for conducting preliminary investigations. To date, no reports have been received through this channel.

Although not mandatory, the Company has adopted an **Organisational Model** and an **autonomous and independent Supervisory Body** with control, verification, and investigation powers over all Company functions since 2005. As part of the **SA8000** certification, a direct communication channel has also been established with **worker representatives** at the Milan headquarters and the Nera Montoro plant. Anonymous reports can also be submitted through dedicated mailboxes.

Additionally, for the past nine years, Alcantara has been a member of the **UNGC**, based on ten universal principles related to human rights, labour, the environment, and the fight against corruption. Membership implies the integration of these principles into business strategies, daily operations, and organisational culture.

Finally, the Company promotes a strong system of **industrial relations**, providing the union with the opportunity for discussion and dialogue at all levels of the Company. The union has access to both formal and informal discussions with the Human Resource Management and meets at least once a year with the Chairman and CEO.

Since 2008, the Company has held the SA8000 certification (the international Social Accountability 8000 standard), which confirms the implementation of measures and procedures to respect human rights and labour rights within the Company and along the value chain.

As shown in the following table, all employees are informed and periodically updated on the principles and values of the standard through training and meetings.

	TRAINING HOURS	TRAINED WORKERS	TRAINING HOURS	TRAINED WORKERS	TRAINING HOURS	TRAINED WORKERS
	FY 2024		FY 2025		FY 2026	
Training on D.lgs.231/01	54	70	6,5	13	72	45
Sustainability projects and SA8000	175	70	35	14	30	14

Prevention and monitoring

To ensure the effectiveness of the control and prevention system, the Company adopts the principle of **segregation of responsibilities**, ensuring that the person responsible for a specific operational activity is always distinct from the one who controls or authorises it. Signing powers are formalised and assigned in accordance with organisational responsibilities, and their exercise must comply with value and subject matter limits, Company directives, and applicable regulations. Each approval process is tracked and documented, and the proposing functions are responsible for ensuring the legitimacy of the practices.

Anti-Corruption Communication and Training

The **Anti-Corruption Officer** is responsible for periodically reviewing the **Anti-Corruption Policy** to ensure its effectiveness, proposing any updates in collaboration with:

- the **Supervisory Body**,
- Alcantara's **Human Resource Management, Organisation and Information Systems**
- the **General Manager of Legal & Administration** of the Toray Group.

Such updates are based on best practices and the evolution of the national and international regulatory framework.

In case of violations, the Responsible Officer assesses the need to modify the Policy or internal procedures to prevent the recurrence of unlawful conduct. They also prepare a **semi-annual report** on monitoring activities, which is sent to the main control and management bodies. This report may include, where appropriate, detailed analyses of the events identified, the causes, the individuals involved, and proposals for corrective action.

In line with applicable regulatory references and the directives of the Toray Group, **Alcantara plans, manages, and monitors** specific anti-corruption training activities, with the goal of ensuring that each employee understands, in relation to their role:

- the corruption risks to which the Organisation and individuals may be exposed;
- the policy and measures adopted for the prevention of corruption;
- the aspects of the anti-corruption management system relevant to their role;
- the preventive actions and methods for reporting risks or suspicions of unlawful conduct.

Participation in training programmes is mandatory for the **internal functions** identified by the Human Resources Management, Organisation and Information Systems Department, which also monitors their proper participation.

The Anti-Corruption Policy is **communicated to all employees and available on the Company intranet**. It is the subject of ongoing information and update initiatives, both during employee onboarding and when there are regulatory or procedural changes. of corruption. The main topics covered include a reflection on the various forms corruption can take, the analysis of internal policies adopted by the Company to combat it, and an explanation of the operational procedures aimed at the timely identification and proper management of any risky behaviours.

4.2 MANAGEMENT OF SUPPLIERS' RELATIONSHIPS

Alcantara adopts a structured and proactive approach to oversee its supply chain, with the aim of identifying, preventing, and mitigating potential social and environmental impacts throughout the entire value chain.

Collaboration with suppliers is considered a key element in the Company's responsible sourcing strategy. In this context, the Company requires its business partners to adhere to specific contractual clauses focused on sustainability, promoting high standards in terms of human rights, working conditions, and social responsibility. In particular:

- through the sharing of the Supply Chain Sustainability Guidelines, Alcantara integrates social and human rights criteria into the supplier selection, qualification, and evaluation processes;
- the Company has adopted the SA8000 standard, one of the main international benchmarks for managing social responsibility;
- it periodically conducts Corporate Social Responsibility Assessments (CSR Assessments) on its suppliers to verify compliance with the Company's sustainability policies and to identify potential areas for improvement.

Protection of human rights and supply chain policies

Alcantara adopts a rigorous and systematic approach to promote the respect for human rights and working conditions throughout its value chain, aligning with the most widely recognised international standards. Through the “**Supply Chain Sustainability Guidelines**” document and **CSR Assessment** audit programmes, the Company defines and communicates its expectations regarding social responsibility to its suppliers. These tools are based on key references such as the United Nations Guiding Principles on Business and Human Rights (UNGPs), the International Labour Organization (ILO) Declaration on Fundamental Principles and Rights at Work, and the OECD Guidelines for Multinational Enterprises.

The **Guidelines** not only establish clear requirements for suppliers, but also promote a direct involvement of supply chain workers through interviews conducted during on-site supplier audits.

The Company's corporate policies explicitly prohibit all forms of **human trafficking, forced labour**, child labour, and any other practices that violate fundamental human rights. These principles are integrated into the **Supplier Code of Conduct**, which serves as a binding annex to contractual agreements with business partners.

Through **due diligence** processes, regular audits, and a **corrective action monitoring system**, the Company assesses and manages potential risks along the supply chain. In addition, grievance and reporting mechanisms are made available to further strengthen the Company's ability to act and ensure transparency.

Tools for supply chain management

Communication channels

Alcantara promotes a culture of transparency and accountability throughout its supply chain by providing workers with a secure and confidential channel to report any irregularities. The Company’s **Whistleblowing Policy** allows supply chain workers to communicate directly with the Company in a confidential manner, through an internal mechanism managed with the utmost care for the protection of the reporting individual. Additionally, the “**Supply Chain Sustainability Guidelines**” require suppliers to establish **effective reporting systems** of their own, accessible to workers. To this end, the Company provides a **dedicated email address – supplychainsustainability@alcantara.com** – through which reports or clarification requests can be submitted. During CSR Assessment audits, the Company verifies the actual presence and accessibility of such mechanisms at suppliers, ensuring that every worker has the opportunity to voice their concerns freely and safely. This network of listening tools helps strengthen the prevention, **monitoring, and management system for social risks** along the supply chain, fostering a fairer, safer working environment that complies with the Company’s ethical standards.

Supplier qualification

In the Fiscal Year 2026, the Company selected **25** suppliers based on environmental criteria and **47** based on social responsibility criteria. Compared to the previous year, the number of suppliers assessed for social responsibility decreased by **1**, while the number of environmental assessments remained unchanged.

NUMBER OF SUPPLIERS SELECTED BASED ON	FY 2024	FY 2025	FY 2026
Environmental criteria	20	20	25
Social criteria	46	48	47

During the Fiscal Year 2026, 9 new suppliers were integrated compared to the previous year. Of these, 3 suppliers were evaluated based on social criteria, representing 33% of new suppliers, while 3 suppliers were evaluated based on environmental criteria, corresponding to 33% of new suppliers.

Supplier evaluation and classification

The Company adopts a structured **suppliers classification system** based on the potential impact level regarding **EHS (environment, health, and safety)** requirements and social responsibility. The final aim is to build monitoring and evaluation activities that are proportionate to the risk.

Regarding **EHS** criteria, suppliers are classified into three risk levels:

- **High impact (HIGH):** for example, suppliers involved in waste management or operating in contexts with significant environmental and safety implications.
- **Medium impact (MEDIUM):** includes **contractors** operating in construction areas and **outsourced third-party services** with a significant presence.

Based on **social responsibility** requirements, the evaluation distinguishes:

- **High impact (HIGH):** “Super CORE” suppliers who play a strategic role in the production or distribution process and are considered critical for managing social risk.
- **Medium impact (MEDIUM):** Suppliers who **continuously operate within Alcantara’s facilities or in partnerships.**

ALCANTARA

Alcantara pays particular attention to the selection and management of suppliers through the implementation of a series of measures and procedures that are aimed at ensuring compliance with the sustainability, quality and safety policies we have adopted. During the Fiscal Year 2026, the Company intensified its audits and activities related to findings management. The inspections were supported by a risk analysis based on the most exposed geographical areas, identified through a supply chain mapping process. This approach allowed the Company to pinpoint potentially critical contexts and take targeted actions. These are the main supplier verification and evaluation activities carried out by the Company:

- in the last three Fiscal Years, audits conducted to verify the ability to meet specific supply conditions and compliance with the requirements of certified management systems (quality, safety, environment, social responsibility) have been run on site and online;
- incentives for the adoption of programmes to optimise energy consumption, reduce hazardous materials, reduce emissions, use recycled materials and optimise waste management. The Company verifies that the programmes are correctly implemented through objective documentary evidence and through technical/ organisational audits at suppliers;

- updated mapping of suppliers based on the identification of important factors for assessing the environmental and social risks associated with supply, adherence to the code of ethics and participation;
- the signing by suppliers of work and services contracts, within the contracts signed, who undertake to comply with the principles referred to in the SA8000 standard and to observe, for the purposes of the execution of the tasks conferred, the General Part of the Organisational Model (as per Italian Legislative Decree no. 231/2001) and the Alcantara’s Code of Ethics;
- promotion, among its suppliers (and sub-suppliers), of transparent and ethical conduct, and responsible management paths, in compliance with the principles of environmental protection, human rights, labour standards and the fight against corruption;
- sharing of the guidelines issued by the Company to improve sustainability performance along the supply chain.

AREA INVESTIGATED IN FY 2024-2026	ASSESSMENT	RATING PER AREA
Commitment to responsible management and transparency	GOOD	84%
Fair business practices	GOOD	79%
Market and consumers	GOOD	84%
Working practices and human rights	GOOD	88%
Environment	GOOD	85%
Supply chain and suppliers	GOOD	84%
Community and local region	GOOD	78%
MEDIA	GOOD	83%

Following second-party audits, the Company provides suppliers with an evaluation **report and an improvement plan**, suggesting possible measures to enhance performance in the analysed areas. Findings deriving from audits conducted over the last three Fiscal Years are presented below and classified based on the investigated areas.

IMPROVEMENT MEASURES SUGGESTED IN FY 2024-2026	FY 2024	FY 2025	FY 2026	Total
Commitment to responsible management and transparency	9	2	2	13
Fair business practices	1	2	1	4
Market and consumers	1	1	-	2
Working practices and human rights	-	4	3	7
Environment	7	4	-	11
Supply chain and suppliers	6	7	3	16
Community and local region	1	-	-	1

Within the Company’s supply chain, **126 suppliers are considered priority suppliers**, as the goods or services they provide have a significant economic impact and support activities that may influence stakeholder assessments.

47 of these are called ‘super core’ suppliers (as they operate continuously on our premises or in production process and distribution partnerships), while the remaining 79 are so-called ‘core’ suppliers (as they perform some non-continuous services on corporate premises or can become production process partners).

New suppliers formally affirmed as priority in the Fiscal Year 2026 are included in our long-term evaluation programme. **Two out of four suppliers involved in the CSR audits in the Fiscal Year 2026 are in fact new to this process.** This involves, among other things, an assessment of environmental and social criteria relating to workers’ human rights. In addition to identifying priority suppliers, we generally consider suppliers of the following services/products as strategic:

- product processing;
- contracting and logistics services (technical and maintenance companies operating at the plant and headquarters, warehouse management, transport);
- general services (waste recovery and disposal);
- raw materials.

CSR self-assessment

The **Corporate Social Responsibility (CSR)** assessment along the supply chain enables suppliers to demonstrate their risk management level and identify sustainability opportunities to be adopted. A series of evaluation forms are compiled to identify potential measures aimed at improving performance and creating value sustainably, while reducing the impact on the environment and local communities in which they operate.

Through this initiative, suppliers can respond to Alcantara’s sustainability requirements and align with the socially responsible business model it promotes. Additionally, they can implement more effective governance and control mechanisms through:

- the identification of ethical, social, and environmental risks and opportunities;
- understanding the current level of management of these aspects;
- identifying the necessary actions to reach an acceptable standard;
- evaluating and measuring progress over time;
- engaging employees and encouraging internal dialogue;
- initiating dialogue with other companies and organisations.

Thanks to this assessment model, suppliers can become accredited within Alcantara’s supplier management system, in alignment with sustainability standards.

CSR Supplier assessment

As of the end of the Fiscal Year 2026, the number of accredited suppliers equalled 74% (66.74% in Fiscal Year 2025) of

super-core suppliers were accredited super-core suppliers in the Fiscal Year 2026, in coherence with the previous year, while the percentage of accredited core suppliers amounted to 43% (compared to 39% in the Fiscal Year 2025).

The Company’s goal is to progressively expand the scope of audits, including an increasing number of suppliers, including indirect ones, to ensure a more comprehensive and proactive management of social and environmental impacts along the entire supply chain.

During Fiscal Year 2026, Alcantara continued to strengthen supplier engagement within its climate management strategy, expanding the number and categories of suppliers involved in greenhouse gas emissions quantification and in actions supporting the management of residual emissions. As part of this approach, several suppliers voluntarily purchased verified carbon credits corresponding to the share of emissions associated with products and services supplied to Alcantara. This initiative involved:

- an additional chemicals/auxiliaries supplier, bringing the total number of participating raw material suppliers to 11;
- 12 logistics service providers;
- one industrial services provider.

Independent auditors’ report on the limited assurance of the Sustainability Report 2026

To the Board of Directors of Alcantara S.p.A.

Scope

We have been appointed to perform a limited assurance engagement on the Sustainability Report of Alcantara S.p.A. (hereinafter also the “Company” or “Alcantara”) for the year ended on March 31, 2026.

Directors’ responsibility on the Sustainability Report

The Directors of Alcantara S.p.A. are responsible for the preparation of the Sustainability Report in accordance with the “Global Reporting Initiative Sustainability Reporting Standards” issued by GRI – Global Reporting Initiative (“GRI Standards”), as described in the paragraph “Methodology” of the Sustainability Report.

The Directors are also responsible for that part of internal control that they consider necessary in order to allow the preparation of a Sustainability Report that is free from material misstatements caused by fraud or not intentional behaviors or events.

The Directors are also responsible for defining the commitments of the Company regarding the sustainability performance, as well as the identification of the stakeholders and of the significant matters to report.

Auditors’ independence and quality control

We are independent in accordance with the ethics and independence principles of the International Code of Ethics for Professional Accountants (including International Independence Standards) (IESBA Code) issued by the International Ethics Standards Board for Accountants, based on fundamental principles of integrity, objectivity, professional competence and diligence, confidentiality and professional behavior.

Our audit firm applies the International Standard on Quality Control 1 (ISQM Italy 1), under which it is required to establish, implement, and operate a quality management system that includes instructions and procedures on compliance with ethical principles, professional principles, and applicable legal and regulatory provisions.

EY S.p.A.
Sede Legale: Via Meravigli, 12 – 20123 Milano
Sede Secondaria: Via Lombarda, 21 – 00187 Roma
Capitale Sociale Euro 3.000.000,00 i.v.
Inscritta alla S.O. del Registro delle Imprese presso la CCIAA di Milano Monza Brianza Lodi

Inscritta al Registro Riscatti Legali al n. 70945 Pubblicato sulla G.U. Suppl. 15 - IV Serie Speciale del 17/21/1997

A member firm of Ernst & Young Global Limited

Auditors’ responsibility

It is our responsibility to express, on the basis of the procedures performed, a conclusion about the compliance of the Sustainability Report with the requirements of the GRI Standards. Our work has been performed in accordance with principle of “International Standard on Assurance Engagements ISAE 3000 (Revised) - Assurance Engagements Other than Audits or Reviews of Historical Financial Information” (hereinafter “ISAE 3000 Revised”), issued by the International Auditing and Assurance Standards Board (IAASB) for limited assurance engagements. This principle requires the planning and execution of procedures in order to obtain a limited assurance that the Sustainability Report is free from material misstatements.

Therefore, the extent of work performed in our examination was lower than that required for a full examination according to the ISAE 3000 Revised (“reasonable assurance engagement”) and, hence, it does not provide assurance that we have become aware of all significant matters and events that would be identified during a reasonable assurance engagement.

The procedures performed on the Sustainability Report were based on our professional judgment and included inquiries, primarily with the Company’s personnel responsible for the preparation of the information included in the Sustainability Report, documents analysis, recalculations and other procedures in order to obtain evidences considered appropriate.

In particular, we have performed the following procedures:

- 1. understanding of the process for assessing the materiality of the information included in the Sustainability Report by analyzing the approach adopted by the Company for identifying and assessing the relevant impacts relating to sustainability matters, and verifying the related disclosures reported in the Sustainability Report;
- 2. comparison between the economic and financial data and information reported in the Sustainability Report with those included in the Alcantara’s financial statements;
- 3. understanding of the processes underlying the generation, recording and management of significant qualitative and quantitative information included in the Sustainability Report.

In particular, we conducted interviews and discussions with the management of Alcantara S.p.A. and we have performed limited documentary evidence procedures, in order to collect information about the processes and procedures that support the collection, aggregation, processing and transmission of data and information to the department responsible for the preparation of the Sustainability Report.

Furthermore, for significant information, considering the activities and characteristics of the Company:

- a) with reference to the qualitative information included in the Sustainability Report, we carried out inquiries and acquired supporting documentation to verify its consistency with the available evidence;
- b) with reference to quantitative information, we have performed both analytical procedures and limited assurance procedures to ascertain on a sample basis the correct aggregation of data.

For the production site of Nera Montoro (Terni) of Alcantara S.p.A., we have carried out remote interviews during which we have had discussions with management and have obtained evidence on a sampling basis about the appropriate application of the procedures and the calculation methods used to determine the indicators.

Conclusion

Based on the procedures performed, nothing has come to our attention that causes us to believe that the Sustainability Report of Alcantara S.p.A. for the year ended on March 31, 2026 has not been prepared, in all material aspects, in accordance with the requirements of the GRI Standards, as described in the paragraph “Methodology” of the Sustainability Report.

Other matters

This report is not issued pursuant to any legal requirement, as the Company is not obliged to prepare a Sustainability Report.
